善用雲端架構 打造企業人才庫

對於雲端的運用，多半仍停留在創造新商機的層次，然而善用雲端運算，可以替組織創造更多業務、行銷和人才培訓的機會。

作者：麥肯錫　出處：天下雜誌

過去五年，麥肯錫觀察重要科技發展，其中雲端、大量資訊（big data）、智慧裝置（smart assets）三項，以超乎想像的速度發展。這三大技術，帶來五大趨勢，可被應用在企業營運及組織運作。先分別來看這三項技術：

第一、雲端運算。「雲端」在台灣已被一般民眾熟知。但我認為大家多半仍停留在雲端運算如何能創造新商機，卻很少好好思索，該怎麼運用雲端運算來替組織創造更多機會。特別是服務提供者，譬如電信業者、有線電視業者等，都應更有效應用雲端運算，為業務帶來更多機會。

第二、大量資訊。目前，絕大多數台灣企業，分析大量龐雜資料，仍使用類似微軟工具如excel等來整理。事實上，大量資訊經過快速運算分析，能更省時、省費用、有效的進行行銷活動。

第三、智慧裝置。如何善用監控器、智慧電表這類智慧裝置，來更優化公司營運。

New Data Science : Social Network + Realtime Search
當「社交網路」遇上「即時搜尋」 ＝ 即時市場行銷分析

創意行銷／臉書行銷 每天400萬顧客在線上

【經濟日報/潘俊琳】 2010.10.11 02:20 am

社交網站臉書Facebook的興起，重新定義了網路行銷的概念，大量的人潮讓業者彷彿看到滾滾錢潮，但臉書「開放平台」的模式，讓習慣有規則可循的行銷業者，必須開始學習全新的社群行銷，試著擁抱這項利器並串連消費者。

根據美國comScore的統計，美國網友8月分共花了1,140萬分鐘在臉書上，首次超越停留在Google旗下網站的時間，而臉書全球已經有超過5億的使用者，其中有35%的人每天登入。

快速分享 即時知道顧客反應

聖洋科技執行長邱繼弘表示，台灣臉書每個月約有700萬的累計使用人次，以60%每天上臉書的人口來算，就有420 萬人天天上線。

邱繼弘指出，臉書最大的行銷價值在於「開放平台」，只要符合它的基本規範，任何人、任何公司都可以在上面「免費」發揮自己的行銷創意。過去想要利用網路行銷，企業必須自己架站，林林總總的後台建設非常繁瑣，有多少人會來也是個問號？

但臉書幫企業解決了後台建設以及人潮，不論是企業或個人，只要成立自己的「粉絲專頁」，然後發揮行銷創意，回收可能比自己架站還更豐碩。因為臉書玩家只要在粉絲專頁按「讚」，就成為「粉絲團」的一員，往後企業發布在粉絲專頁的訊息，所有粉絲團成員都會收到，如果粉絲團的成員覺得某個行銷訊息不錯，只要按「分享」這個訊息就會出現在粉絲個人的臉書上，他所有的朋友就會看到這則行銷訊息，這是目前最高明的病毒式行銷。

What is Hadoop ?

用一句話解釋 *Hadoop* 是什麼 ??

Hadoop is a software platform that lets one easily write and run applications that process vast amounts of data.

Hadoop 是一個讓使用者簡易撰寫並執行處理海量資料應用程式的軟體平台。

亦可以想像成一個處理海量資料的生產線，只須學會定義 ***map*** 跟 ***reduce*** 工作站該做哪些事情。

Features of Hadoop …
Hadoop 這套軟體的特色是 …

- **海量 Vast Amounts of Data**
  - 擁有儲存與處理大量資料的能力
  - Capability to STORE and PROCESS vast amounts of data.
- **經濟 Cost Efficiency**
  - 可以用在由一般 PC 所架設的叢集環境內
  - Based on large clusters built of commodity hardware.
- **效率 Parallel Performance**
  - 透過分散式檔案系統的幫助，以致得到快速的回應
  - With the help of HDFS, Hadoop have better performance.
- **可靠 Robustness**
  - 當某節點發生錯誤，能即時自動取得備份資料及佈署運算資源
  - Robustness to add and remove computing and storage resource without shutdown entire system.

What is HDFS ??
什麼是 HDFS ??

- **Hadoop Distributed File System**
  - 實現類似 Google File System 分散式檔案系統
  - Reference from Google File System.
  - 一個易於擴充的分散式檔案系統，目的爲對大量資料進行分析
  - A scalable distributed file system for large data analysis .
  - 運作於廉價的普通硬體上，又可以提供容錯功能
  - based on commodity hardware with high fault-tolerant.
  - 給大量的用户提供總體性能較高的服務
  - It have better overall performance to serve large amount of users.

Features of HDFS ...
HDFS 的特色是 ...

- **硬體錯誤容忍能力 Fault Tolerance**
  - 硬體錯誤是正常而非異常
  - Failure is the norm rather than exception
  - 自動恢復或故障排除
  - automatic recovery or report failure
- **串流式的資料存取 Streaming data access**
  - 批次處理多於用户交互處理
  - Batch processing rather than interactive user access.
  - 高 Throughput 而非低 Latency
  - High aggregate data bandwidth (throughput)

Features of HDFS ...
HDFS 的特色是 ...

- **大規模資料集 Large data sets and files**
  - 支援 Petabytes 等級的磁碟空間
  - Support Petabytes size
- **一致性模型 Coherency Model**
  - 一次寫入，多次存取 Write-once-read-many
  - 簡化一致性處理問題 This assumption simplifies coherency
- **在地運算 Data Locality**
  - 到資料的節點上計算 > 將資料從遠端複製過來計算
  - “move compute to data” > “move data to compute”
- **異質平台移植性 Heterogeneous**
  - 即使硬體不同也可移植、擴充
  - HDFS could be deployed on different hardware

Coherency Model and Performance of HDFS
HDFS 的一致性機制與效能 ...

- **檔案一致性機制 Coherency model of files**
  - 刪除檔案＼新增寫入檔案＼讀取檔案皆由名稱節點負責
  - NameNode handle the operation of write, read and delete.
- **巨量空間及效能機制 Large Data Set and Performance**
  - 預設每個區塊大小以 64MB 爲單位
  - By default, the block size is 64MB
  - 大區塊可提高存取效率
  - Bigger block size will enhance read performance
  - 檔案有可能大過一顆磁碟
  - Single file stored on HDFS might be larger than single physical disk of DataNode.
  - 區塊均勻散佈各節點以分散讀取流量
  - Fully distributed blocks increase throughput of reading.

What is MapReduce ??
什麼是 MapReduce ??

- MapReduce 是 Google 申請的軟體專利，主要用來處理大量資料
- **MapReduce is a patented software framework introduced by Google to support distributed computing on large data sets on clusters of computers.**
- 啓發自函數編程中常用的 map 與 reduce 函數。
- **The framework is inspired by map and reduce functions commonly used in functional programming, although their purpose in the MapReduce framework is not the same as their original forms**
  - Map(...) : N → N
    - Ex. [1,2,3,4] – (*2) -> [2,4,6,8]
  - Reduce(...): N → 1
    - [1,2,3,4] - (sum) -> 10
- **Logical view of MapReduce**
    - Map(k1, v1) -> list(k2, v2)
    - Reduce(k2, list (v2)) -> list(k3, v3)

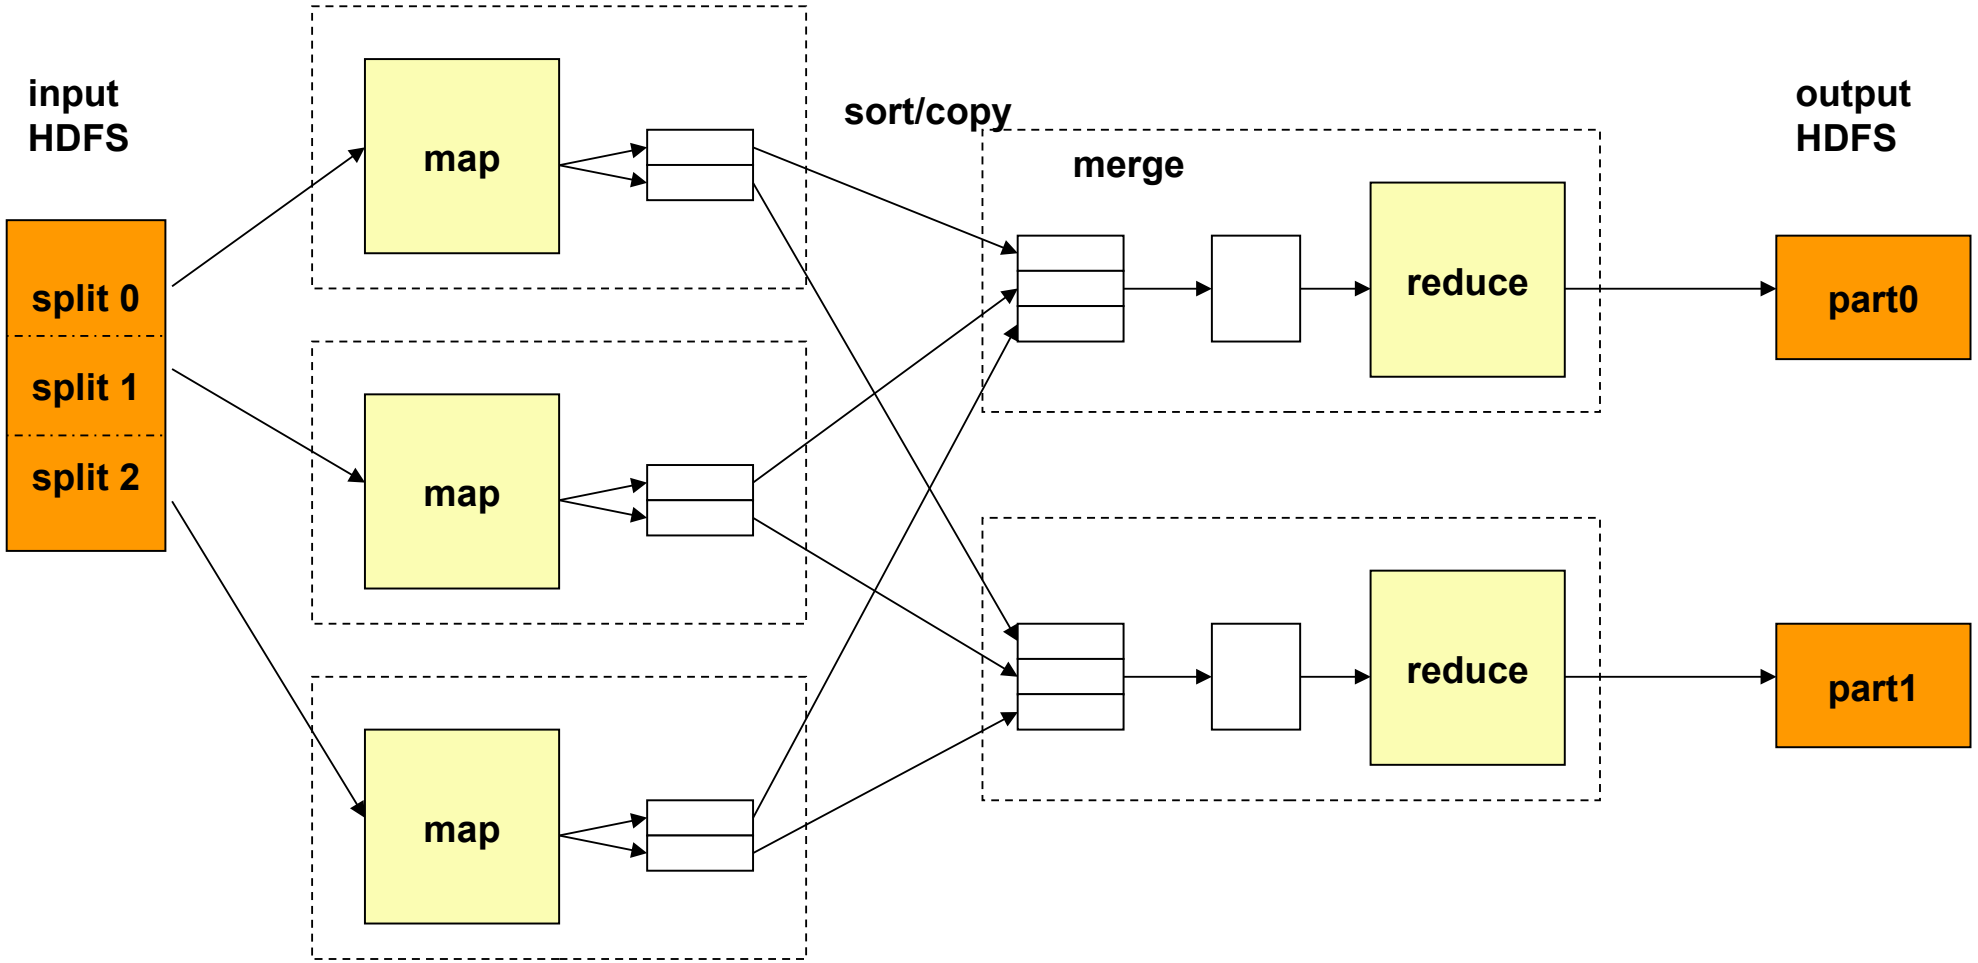
How does MapReduce work in Hadoop

Hadoop MapReduce 運作流程



JobTracker 跟 NameNode 取得需要運算的 blocks

JobTracker 選數個 TaskTracker 來作 Map 運算，產生些中間檔案

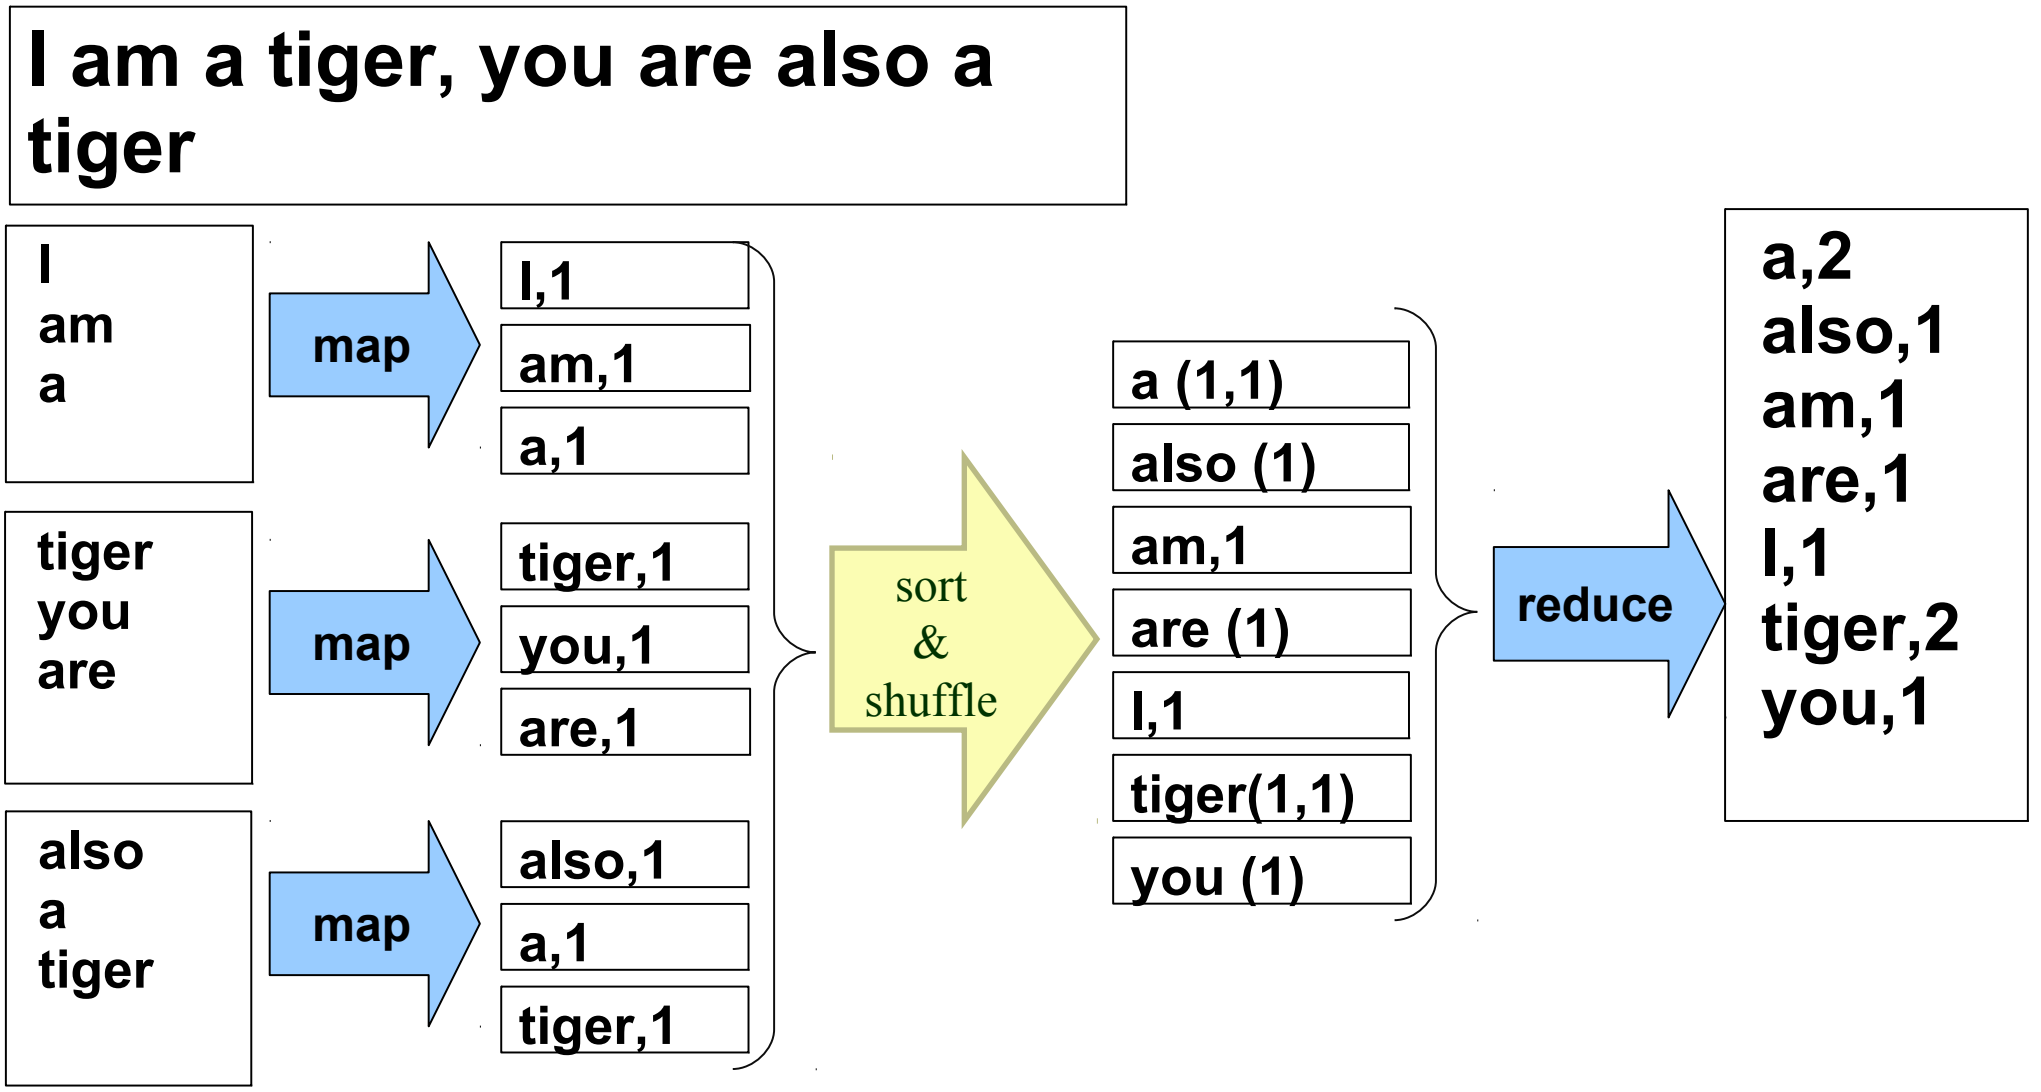
JobTracker 將中間檔案整合排序後，複製到需要的 TaskTracker 去

JobTracker 派遣 TaskTracker 作 reduce

reduce 完後通知 JobTracker 與 Namenode 以產生 output

MapReduce by Example (1)

MapReduce 運作實例 (1)



JobTracker 先選了三個 Tracker 做 map

Map 結束後，hadoop 進行中間資料的重組與排序

JobTracker 再選一個 TaskTracker 作 reduce

MapReduce by Example (2)

MapReduce 運作實例 (2)

$$\begin{bmatrix} a & b \\ c & d \end{bmatrix} \Rightarrow \begin{bmatrix} \text{sqrt}(a+b) \\ \text{sqrt}(c+d) \end{bmatrix}$$

$$\begin{bmatrix} 1.0 & 0.0 & 3.0 \\ 3.2 & 0.8 & 32.0 \\ 1.0 & 14.0 & 1.0 \end{bmatrix} \Rightarrow ?$$

```
(0,sqrt(1.0 +  0.0 +  3.0))
(1,sqrt(3.2 +  0.8 + 32.0))
(2,sqrt(1.0 + 14.0 +  1.0))

- Integrate with dynamic cluster deployments

SmartFrog - HPLabs' CM tool

- Language for describing systems to deploy —everything from datacentres to test cases
- Runtime to create *components* from the model
- Components have a lifecycle
- LGPL Licensed, Java 5+

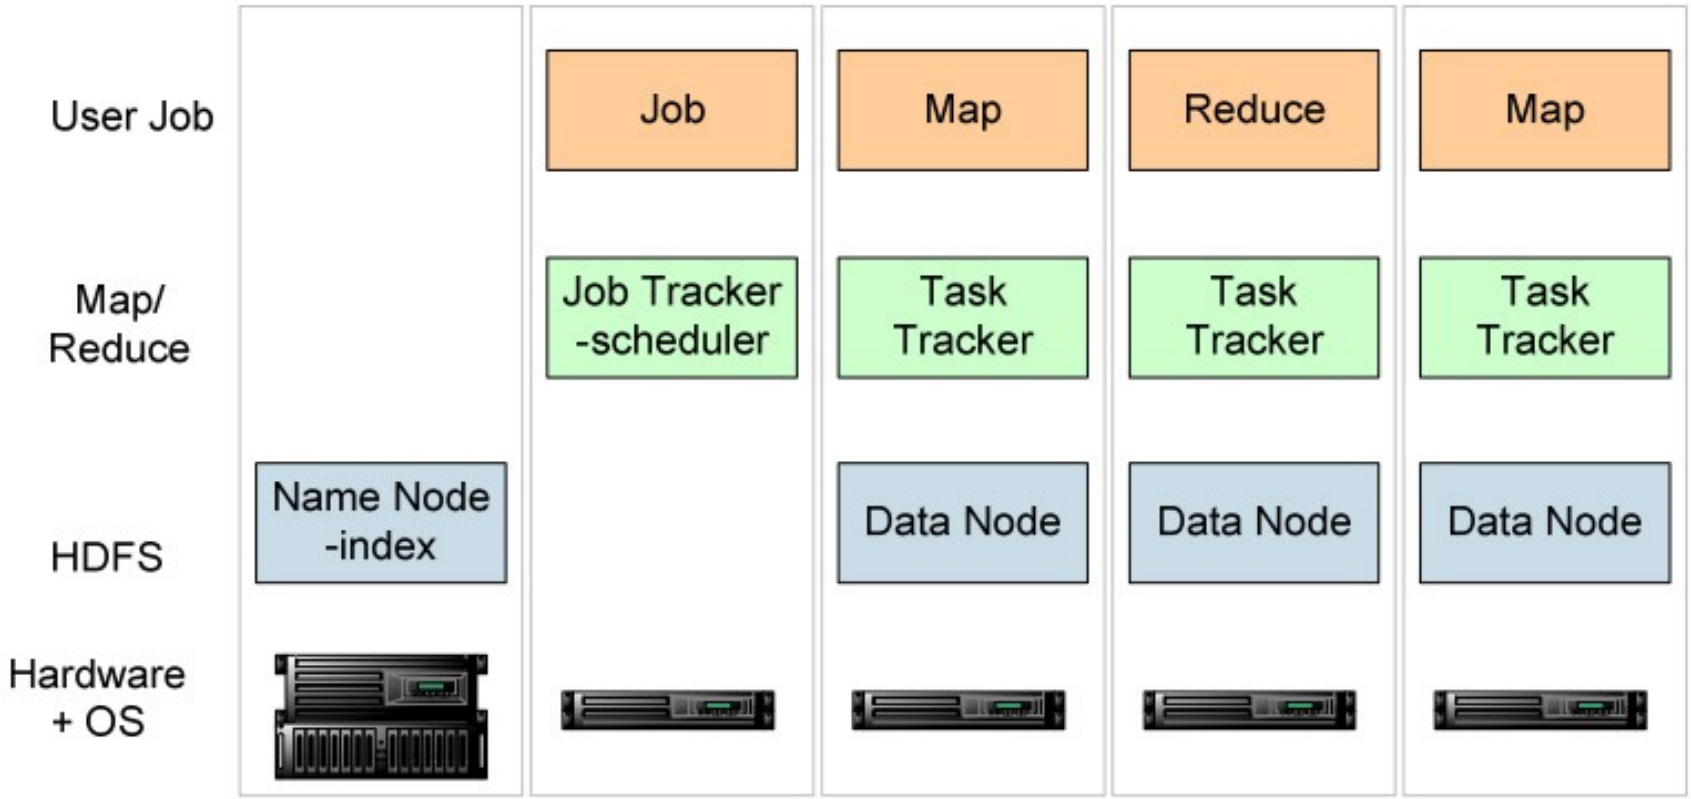
Basic problem: deploying Hadoop



one namenode, 1+ Job Tracker, many data nodes and task trackers

Source: Deploying hadoop with smartfrog
http://people.apache.org/~stevel/slides/deploying_hadoop_with_smartfrog.pdf

The hand-managed cluster

- Manual install onto machines
- SCP/FTP in Hadoop zip
- copy out hadoop-site.xml and other files
- edit /etc/hosts, /etc/rc5.d, SSH keys …
- Installation scales O(N)
- Maintenance, debugging scales worse

Source: Deploying hadoop with smartfrog
http://people.apache.org/~stevel/slides/deploying_hadoop_with_smartfrog.pdf

The locked-down cluster

- PXE Preboot of OS images
- RedHat Kickstart to serve up (see instalinux.com)
- Maybe: LDAP to manage state, or custom RPMs

Requires:

uniform images, central LDAP service, good ops team, stable configurations, home-rolled RPMs

Source: Deploying hadoop with smartfrog
http://people.apache.org/~stevel/slides/deploying_hadoop_with_smartfrog.pdf

CM-tool managed cluster

Configuration Management tools

- State Driven: observe system state, push it back into the desired state
- Workflow: apply a sequence of operations to change a machine's state
- Centralized: central DB in charge
- Decentralized: machines look after themselves

CM tools are the only way to manage big clusters

Model the system in the SmartFrog language

```
TwoNodeHDFS extends OneNodeHDFS {

  localDataDir2 extends TempDirWithCleanup {

  }

  datanode2 extends datanode {
    dataDirectories [LAZY localDataDir2];
    dfs.datanode.https.address "https://localhost:0";
  }
}
```

The runtime deploys the model

Steps to deployability

1. Configure Hadoop from an SmartFrog description
2. Write components for the Hadoop nodes
3. Write the functional tests
4. Add *workflow* components to work with the filesystem; submit jobs
5. Get the tests to pass

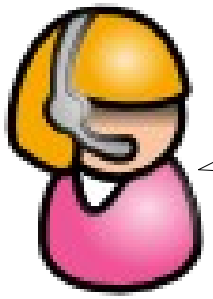
Hadoop 只支援用 **Java** 開發嘛？

Is Hadoop only support Java ?

總不能全部都重新設計吧？如何與舊系統相容？

Can Hadoop work with existing software ?



可以跟資料庫結合嘛？

Can Hadoop work with Databases ?

開發者們有聽到大家的需求 . . . . .

Yes, we hear the feedback of developers ...

Is Hadoop only support Java ?

- Although the Hadoop framework is implemented in Java™, Map/Reduce applications need not be written in Java.
- Hadoop Streaming is a utility which allows users to create and run jobs with any executables (e.g. shell utilities) as the mapper and/or the reducer.
- Hadoop Pipes is a SWIG-compatible C++ API to implement Map/Reduce applications (non JNI™ based).

Hadoop Pipes (C++, Python)

- Hadoop Pipes allows C++ code to use Hadoop DFS and map/reduce.
- The C++ interface is "swigable" so that interfaces can be generated for python and other scripting languages.
- For more detail, check the API Document of org.apache.hadoop.mapred.pipes
- You can also find example code at

  hadoop-*/src/examples/pipes
- About the pipes C++ WordCount example code:

  http://wiki.apache.org/hadoop/C++WordCount

Hadoop Streaming

- Hadoop Streaming is a utility which allows users to create and run Map-Reduce jobs with any executables (e.g. Unix shell utilities) as the mapper and/or the reducer.
- It's useful when you need to run existing program written in shell script, perl script or even PHP.
- Note: both the mapper and the reducer are executables that read the input from STDIN (line by line) and emit the output to STDOUT.
- For more detail, check the official document of Hadoop Streaming

Running Hadoop Streaming

```
jazz@hadoop:~$ hadoop jar hadoop-streaming.jar -help
10/08/11 00:20:00 ERROR streaming.StreamJob: Missing required option -input
Usage: $HADOOP_HOME/bin/hadoop [--config dir] jar \
          $HADOOP_HOME/hadoop-streaming.jar [options]
Options:
  -input    <path>     DFS input file(s) for the Map step
  -output   <path>     DFS output directory for the Reduce step
  -mapper   <cmd|JavaClassName>      The streaming command to run
  -combiner <JavaClassName> Combiner has to be a Java class
  -reducer  <cmd|JavaClassName>      The streaming command to run
  -file     <file>     File/dir to be shipped in the Job jar file
  -dfs    <h:p>|local  Optional. Override DFS configuration
  -jt     <h:p>|local  Optional. Override JobTracker configuration
  -additionalconfspec specfile  Optional.
  -inputformat TextInputFormat(default)|SequenceFileAsTextInputFormat|
JavaClassName Optional.
  -outputformat TextOutputFormat(default)|JavaClassName  Optional.
```

… More …

Hadoop Streaming with shell commands (1)

```
hadoop:~$ hadoop fs -rmr input output
hadoop:~$ hadoop fs -put /etc/hadoop/conf input
hadoop:~$ hadoop jar hadoop-streaming.jar -input
input -output output -mapper /bin/cat
-reducer /usr/bin/wc
```

Hadoop Streaming with shell commands (2)

```
hadoop:~$ echo "sed -e \"s/ /\n/g\" | grep ." > streamingMapper.sh
hadoop:~$ echo "uniq -c | awk '{print \$2 \"\t\" \$1}'" > streamingReducer.sh
hadoop:~$ chmod a+x streamingMapper.sh
hadoop:~$ chmod a+x streamingReducer.sh
hadoop:~$ hadoop fs -put /etc/hadoop/conf input
hadoop:~$ hadoop jar hadoop-streaming.jar -input input -output output -mapper streamingMapper.sh -reducer streamingReducer.sh -file streamingMapper.sh -file streamingReducer.sh

There are serveral Hadoop subprojects

- Hadoop Common: The common utilities that support the other Hadoop subprojects.
- HDFS: A distributed file system that provides high throughput access to application data.

Hadoop Ecosystem

Avro

- Avro is a data serialization system.
- It provides:
  - *Rich data structures.*
  - *A compact, fast, binary data format.*
  - *A container file, to store persistent data.*
  - *Remote procedure call (RPC).*
  - *Simple integration with dynamic languages.*
- Code generation is not required to read or write data files nor to use or implement RPC protocols. Code generation as an optional optimization, only worth implementing for statically typed languages.
- For more detail, please check the official document: http://avro.apache.org/docs/current/

Zoo Keeper

- http://hadoop.apache.org/zookeeper/
- ZooKeeper is a centralized service for maintaining configuration information, naming, providing distributed synchronization, and providing group services. All of these kinds of services are used in some form or another by distributed applications.
- *Each time they are implemented there is a lot of work that goes into fixing the bugs and race conditions that are inevitable. Because of the difficulty of implementing these kinds of services, applications initially usually skimp on them ,which make them brittle in the presence of change and difficult to manage. Even when done correctly, different implementations of these services lead to management complexity when the applications are deployed.*

Pig

- http://hadoop.apache.org/pig/
- Pig is a platform for analyzing large data sets that consists of a high-level language for expressing data analysis programs, coupled with infrastructure for evaluating these programs.
- Pig's infrastructure layer consists of a compiler that produces sequences of Map-Reduce programs
- Pig's language layer currently consists of a textual language called Pig Latin, which has the following key properties:
  - Ease of programming
  - Optimization opportunities
  - Extensibility

Hive

- http://hadoop.apache.org/hive/
- Hive is a data warehouse infrastructure built on top of Hadoop that provides tools to enable easy data summarization, adhoc querying and analysis of large datasets data stored in Hadoop files.
- Hive QL is based on SQL and enables users familiar with SQL to query this data.

Chukwa

- http://hadoop.apache.org/chukwa/
- Chukwa is an open source data collection system for monitoring large distributed systems.
- built on top of HDFS and Map/Reduce framework
- includes a flexible and powerful toolkit for displaying, monitoring and analyzing results to make the best use of the collected data.

Mahout

- http://mahout.apache.org/
- Mahout is a scalable machine learning libraries.
- implemented on top of Apache Hadoop using the map/reduce paradigm.
- Mahout currently has
  - Collaborative Filtering
  - User and Item based recommenders
  - K-Means, Fuzzy K-Means clustering
  - Mean Shift clustering

HBase is ..

- HBase is a distributed column-oriented database built on top of HDFS.
- A distributed data store that can scale horizontally to 1,000s of commodity servers and petabytes of indexed storage.
- Designed to operate on top of the Hadoop distributed file system (HDFS) or Kosmos File System (KFS, aka Cloudstore) for scalability, fault tolerance, and high availability.
- Integrated into the Hadoop map-reduce platform and paradigm.

Benefits

- Distributed storage
- Table-like in data structure
  - multi-dimensional map
- High scalability
- High availability
- High performance

Who use HBase

- Adobe
  - 內部使用 (Structure data)
- Kalooga
  - 圖片搜尋引擎 http://www.kalooga.com/
- Meetup
  - 社群聚會網站 http://www.meetup.com/
- Streamy

- Yahoo!

- More - http://wiki.apache.org/hadoop/Hbase/PoweredBy

Backdrop

- Started toward by Chad Walters and Jim
- 2006.11
  - Google releases paper on BigTable
- 2007.2
  - Initial HBase prototype created as Hadoop contrib.
- 2007.10
  - First useable HBase
- 2008.1
  - Hadoop become Apache top-level project and HBase becomes subproject
- 2008.10~
  - HBase 0.18, 0.19 released

HBase Is Not …

- Tables have one primary index, the *row key*.
- No join operators.
- Scans and queries can select a subset of available columns, perhaps by using a wildcard.
- There are three types of lookups:
  - Fast lookup using row key and optional timestamp.
  - Full table scan
  - Range scan from region start to end.

HBase Is Not …(2)

- Limited atomicity and transaction support.
  - HBase supports multiple batched mutations of single rows only.
  - Data is unstructured and untyped.
- No accessed or manipulated via SQL.
  - Programmatic access via Java, REST, or Thrift APIs.
  - Scripting via JRuby.

Why Bigtable?

- Performance of RDBMS system is good for transaction processing but for very large scale analytic processing, the solutions are commercial, expensive, and specialized.
- Very large scale analytic processing
  - Big queries – typically range or table scans.
  - Big databases (100s of TB)

Why Bigtable? (2)

- Map reduce on Bigtable with optionally Cascading on top to support some relational algebras may be a cost effective solution.
- Sharding is not a solution to scale open source RDBMS platforms
  - Application specific
  - Labor intensive (re)partitionaing

Why HBase ?

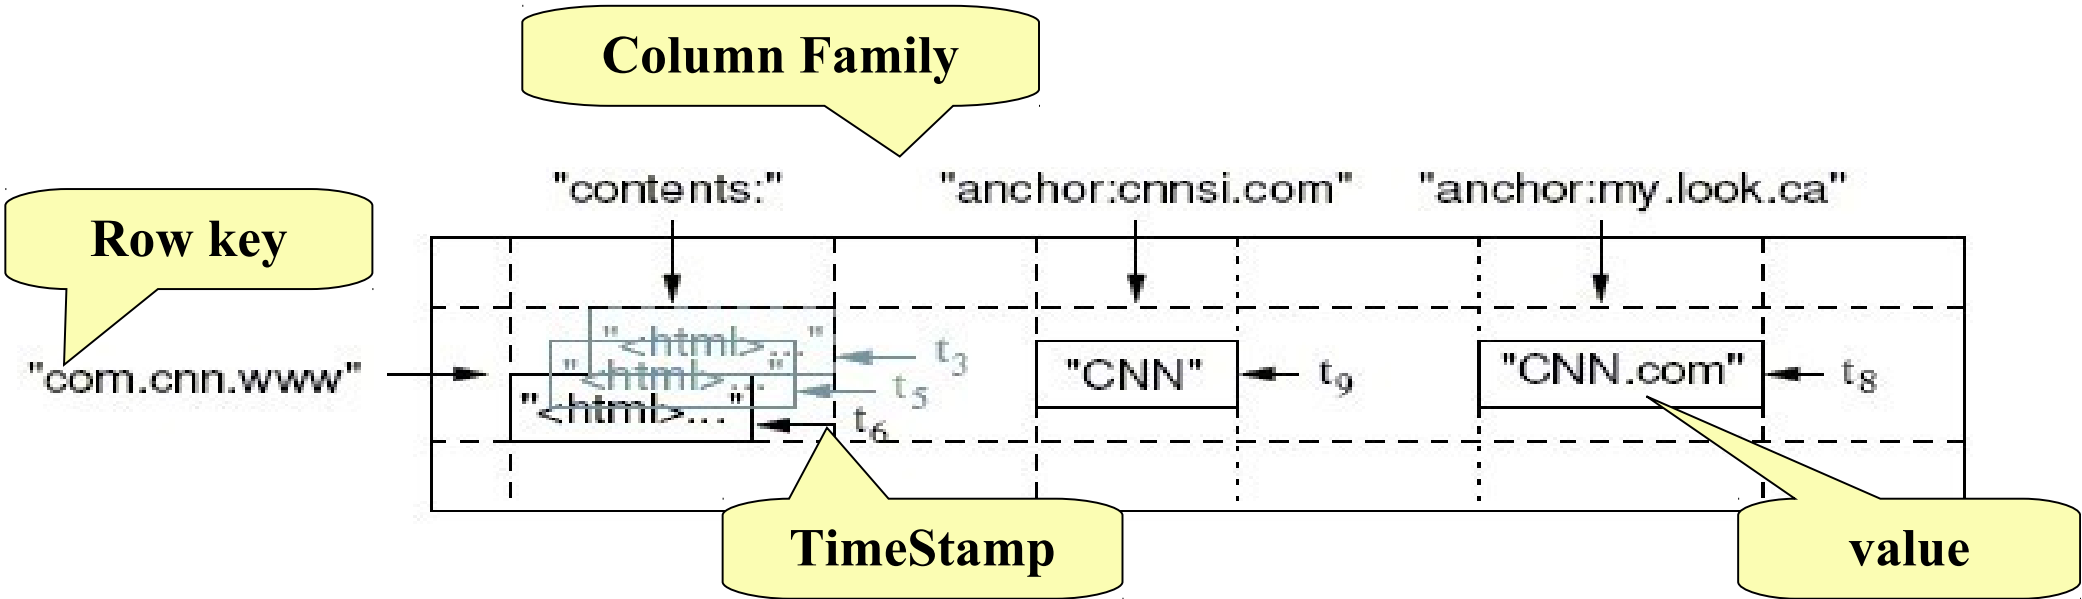
- HBase is a Bigtable clone.
- It is open source
- It has a good community and promise for the future
- It is developed on top of and has good integration for the Hadoop platform, if you are using Hadoop already.
- It has a Cascading connector.

HBase benefits than RDBMS

- *No real indexes*
- *Automatic partitioning*
- *Scale linearly and automatically with new nodes*
- *Commodity hardware*
- *Fault tolerance*
- *Batch processing*

Data Model

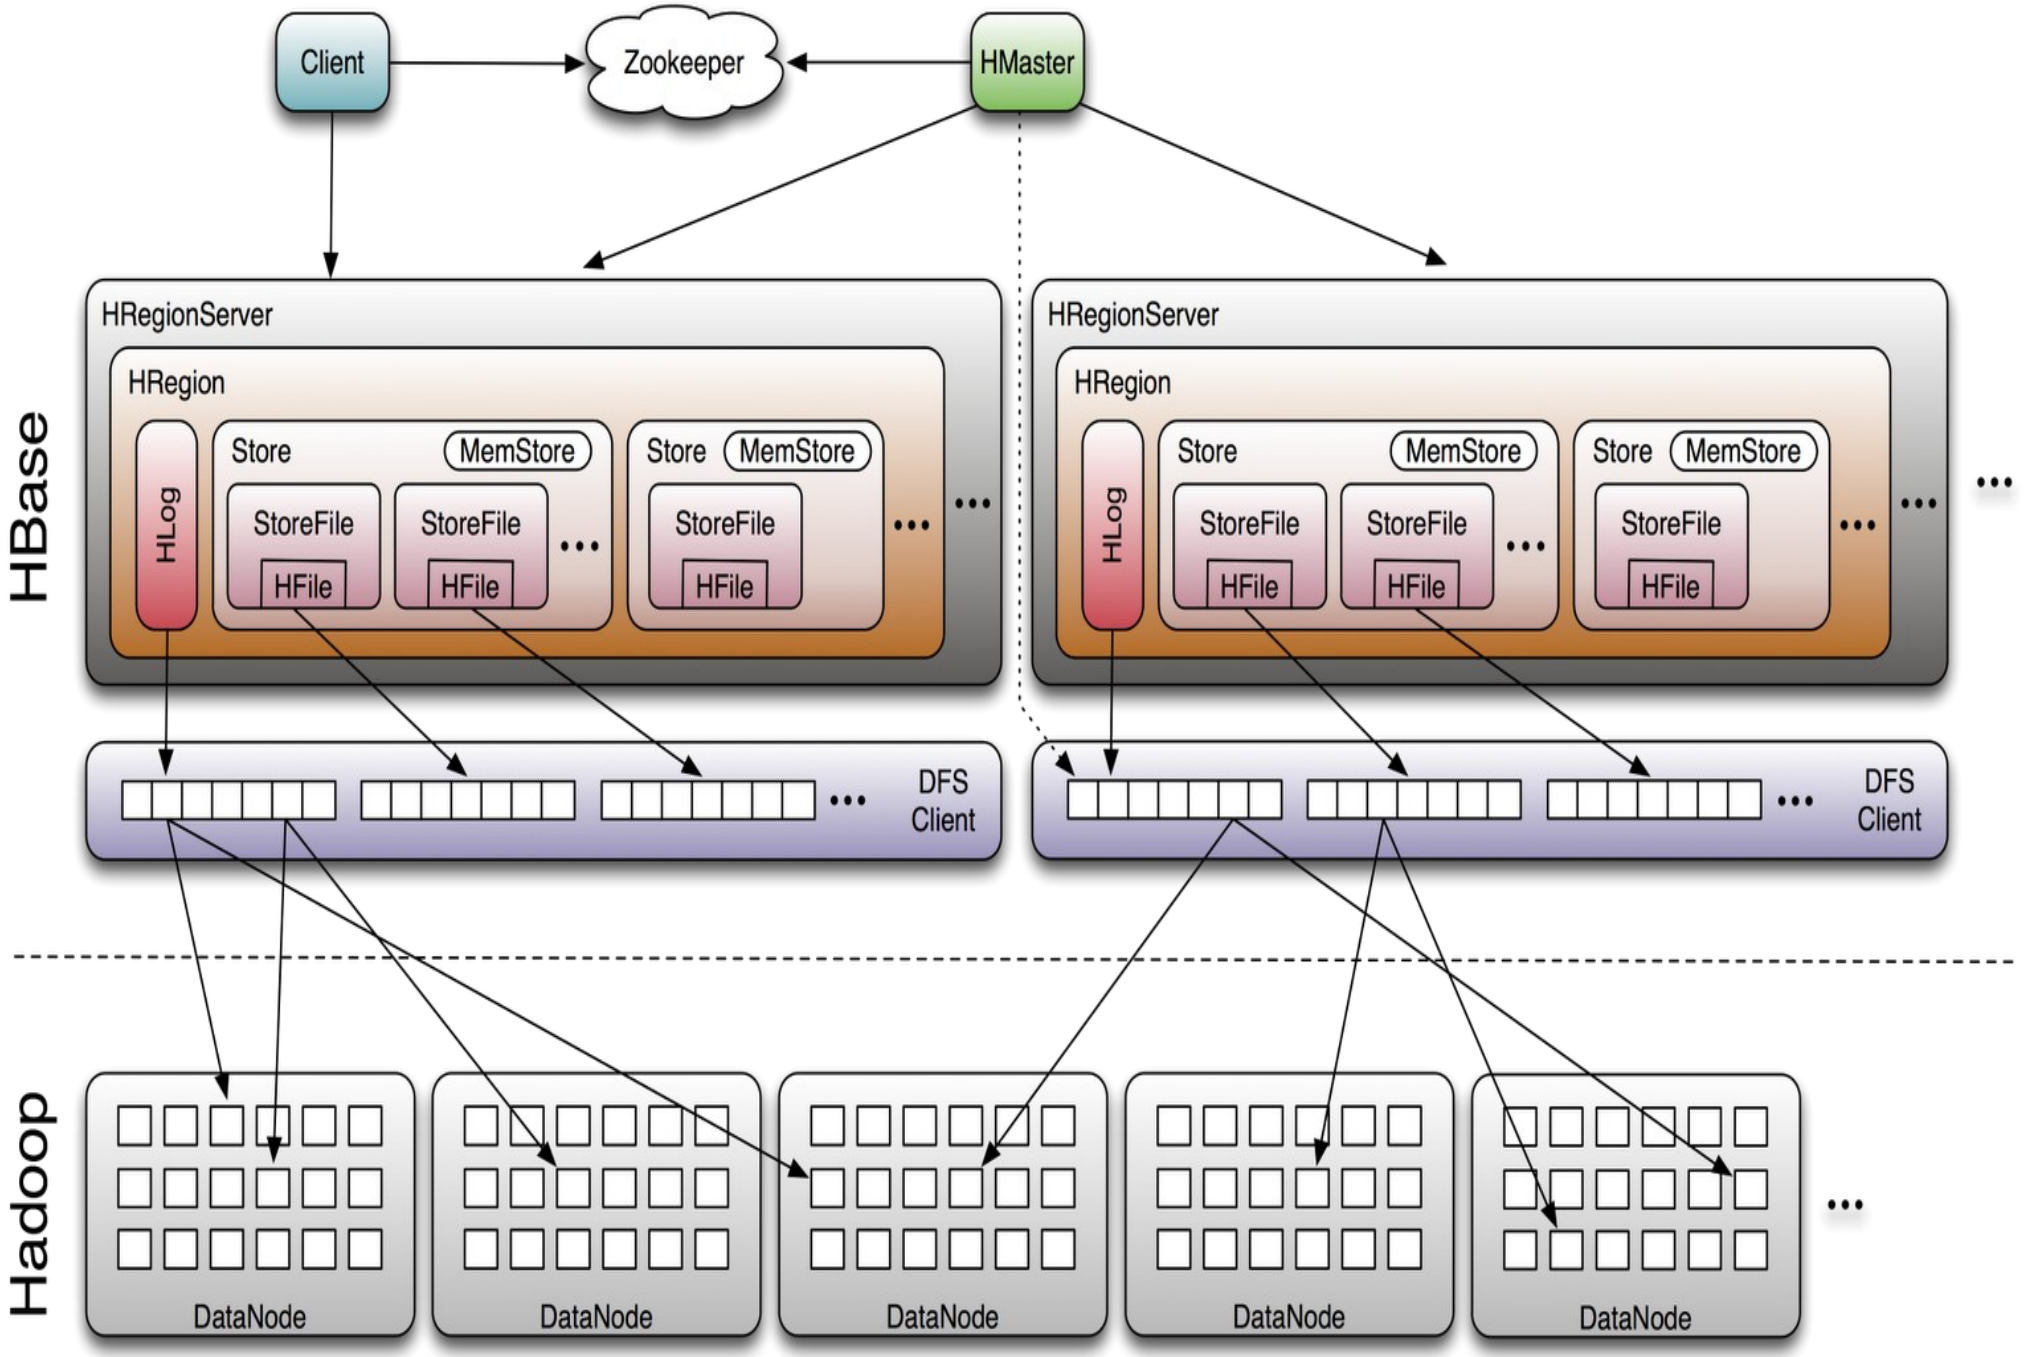
- Tables are sorted by Row
- Table schema only define it's *column families* .
  - Each family consists of any number of columns
  - Each column consists of any number of versions
  - Columns only exist when inserted, NULLs are free.
  - Columns within a family are sorted and stored together
- Everything except table names are byte[]
- (Row, Family: Column, Timestamp) → Value



Members

- *Master*
  - Responsible for monitoring region servers
  - Load balancing for regions
  - Redirect client to correct region servers
  - The current SPOF
- *regionserver* slaves
  - Serving requests(Write/Read/Scan) of Client
  - Send HeartBeat to Master
  - Throughput and Region numbers are scalable by region servers

Architecture



ZooKeeper

- HBase depends on ZooKeeper (Chapter 13) and by default it manages a ZooKeeper instance as the authority on cluster state

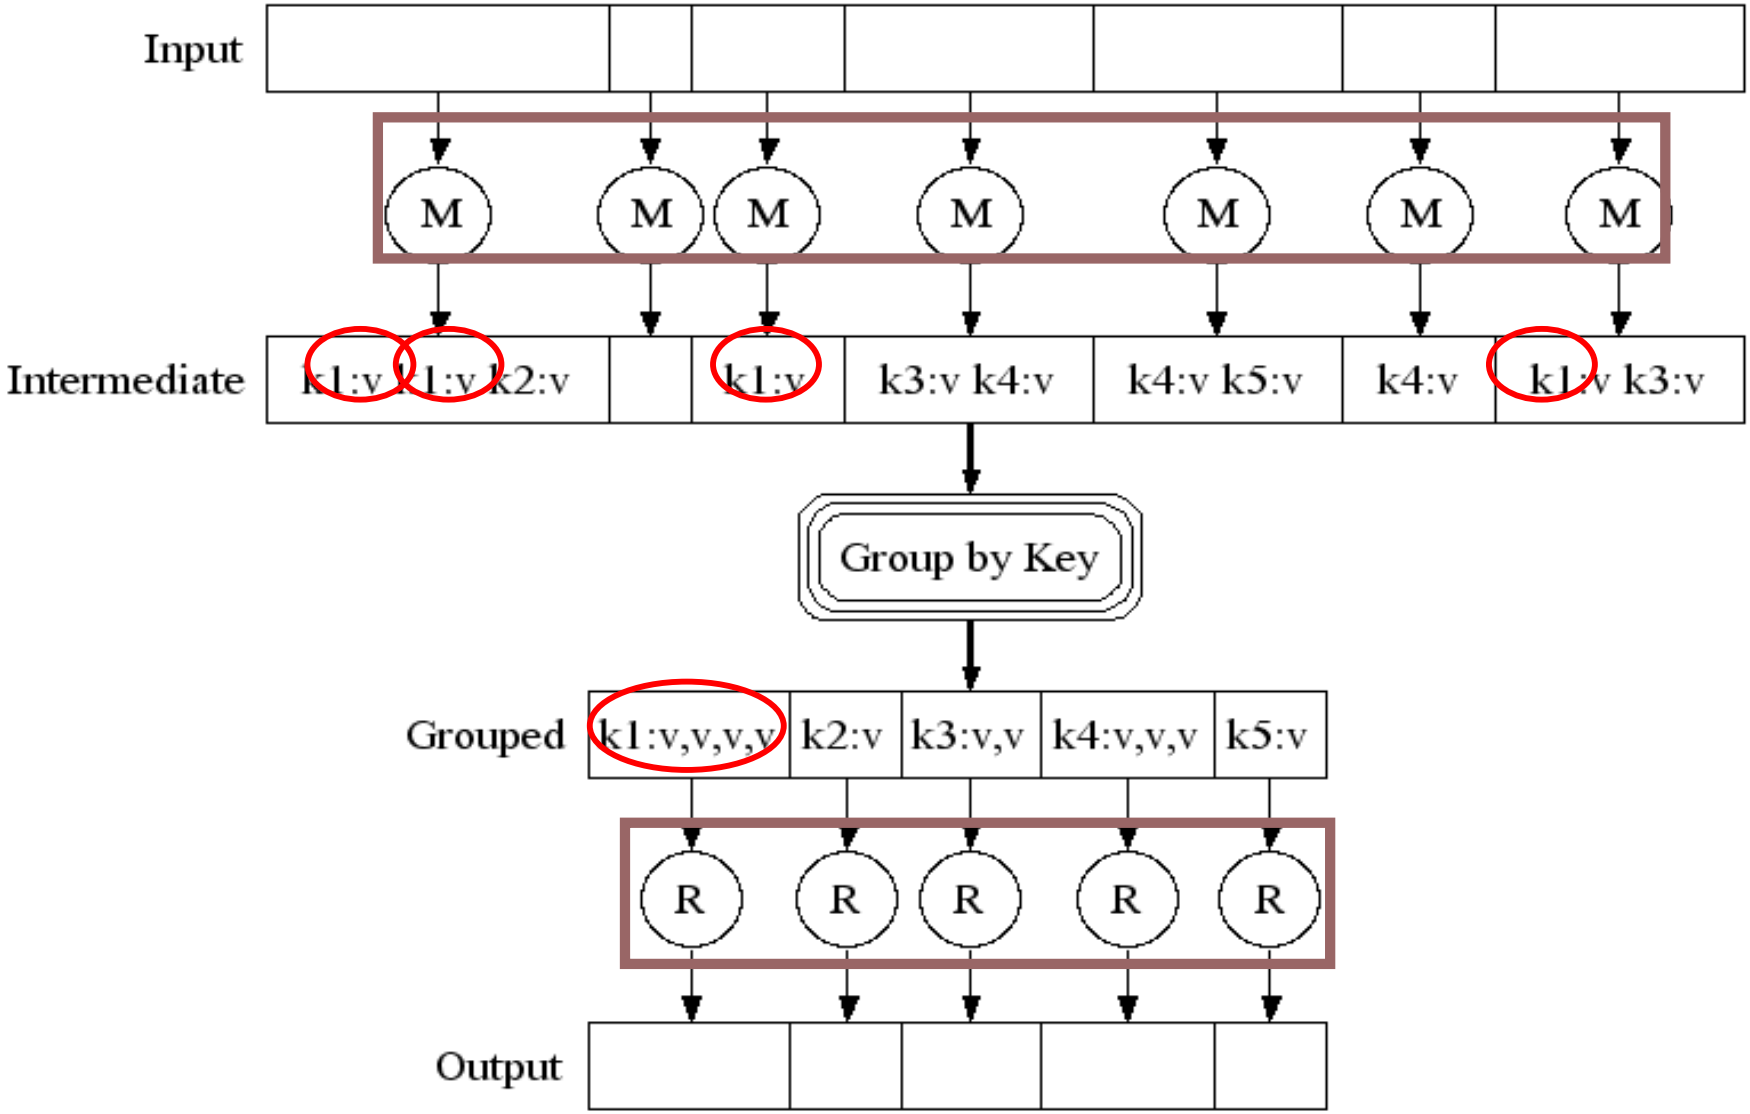
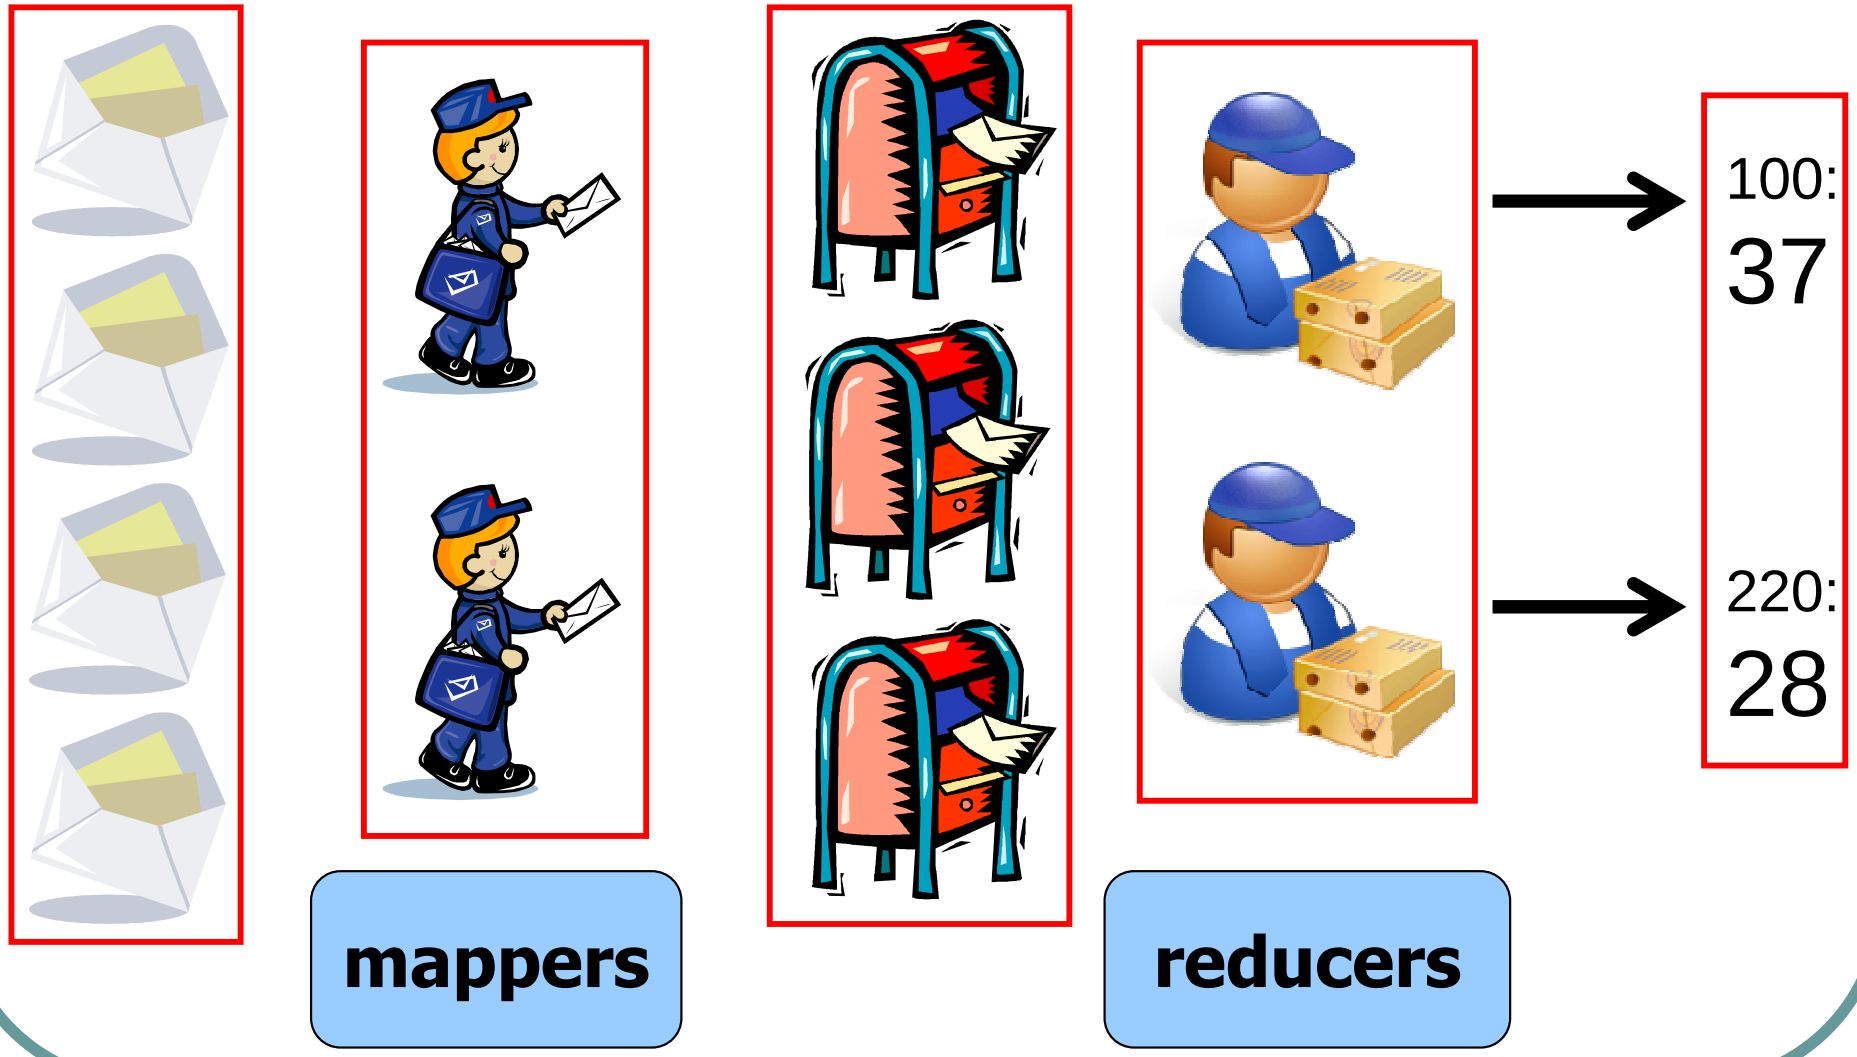
Hadoop Programming – Map/Reduce



Map / Reduce



Map-Reduce

- 全新想法
- 須分別撰寫 mappers & reducers
- 會有超級無敵霹靂多的 mapper/reducer 要維護！

We usually do …

- 大部份時候:
  - filtering, projecting
  - grouping, aggregation, joining
- 今天有多少人搜尋「美國生」

Pig (Latin)

- Procedural dataflow language (Pig Latin) for Map-Reduce
  - 很像 SQL
    - group, join, filter, sort …
  - 人人都會 SQL

Pig Script Example

- Top sites visited by users aged 18 to 25

```
Users = LOAD ‘users.in’ AS (name, age);
Fltrd = FILTER Users by age >= 18 and age <= 25;

Pages = LOAD ‘pages.in’ AS (user, url);

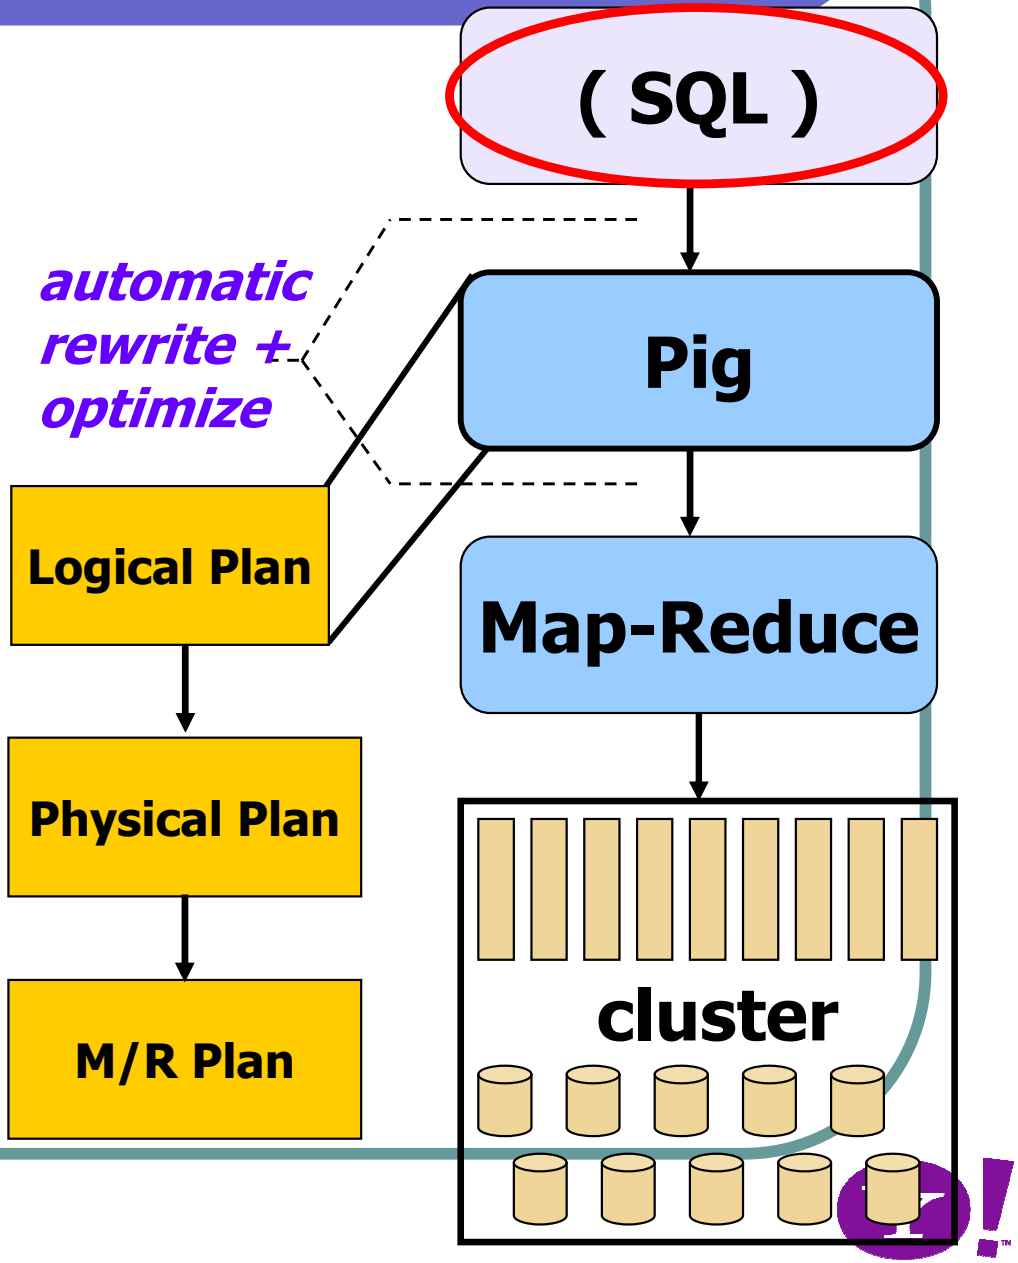
Jnd   = JOIN Fltrd BY name, Pages BY user;
Grpd  = GROUP Jnd by url;
Smmd  = FOREACH Grpd GENERATE group, COUNT(Jnd) AS
        clicks;

Srtd  = ORDER Smmd BY clicks;
Top100 = LIMIT Srtd 100;

STORE Top100 INTO ‘top100sites.out’;
```

Pig script → Map/Reduce

- 不需懂底下 Map-Reduce 運作
- Pig 幫忙翻譯



Why Pig?

- 容易學
- 開發快
- 一目瞭然

Why Pig?

```
Users = LOAD ‘users’ AS (name, age);
Fltrd = FILTER Users by age >= 18 and age <= 25;
Pages = LOAD ‘pages’ AS (user, url);
Jnd   = JOIN Fltrd BY name, Pages BY user;

Why (NOT) Pig?

- 不是史上究極霹靂大無敵武器
  - Focus: aggregation, filter, join,…
- 另一種做分散運算工作的方式

Sweet spot between SQL – M/R

	SQL	Pig	Map-Reduce
Programming style	Large blocks of declarative constraints	➔	"Plug together pipes"
Built-in data manipulations	Group-by, Sort, Join, Filter, Aggregate, Top-k, etc...	➔	Group-by, Sort
Execution model	Fancy; trust the query optimizer	➔	Simple, transparent
Opportunities for automatic optimization	Many	➔	Few (logic buried in map() and reduce())
Data Schema	Must be known at table creation	➔	Not required, may be defined at runtime

Execution and Syntax

Pig Example

- Show users aged 18-25

```
Users = LOAD 'users.txt'
        USING PigStorage(',') AS (name, age);
Fltrd = FILTER Users
        BY age >= 18 AND age <= 25;
Names = FOREACH Fltrd GENERATE name;

STORE Names INTO 'names.out';
```

How to execute

- Local:
  - `pig -x local foo.pig`
- Hadoop (HDFS):
  - `pig foo.pig`
  - `pig -Dmapred.job.queue.name=xxx foo.pig`
    - `hadoop queue -showacls`

How to execute

- Interactive pig shell
  - `$ pig`
  - grunt> _

Load Data

```
Users = LOAD 'users.txt'
        USING PigStorage(',') AS (name, age);
```

- LOAD … AS …
- PigStorage(‘,’) to specify separator

```
John,18
Mary,20
Bob,30
```

name	age
John	18
Mary	20
Bob	30

Filter

```
Fltrd = FILTER Users
        BY age >= 18 AND age <= 25;
```

- FILTER … BY …
  - constraints can be composite

name	age
John	18
Mary	20
Bob	30

name	age
John	18
Mary	20

Generate / Project

```
Names = FOREACH Fltrd GENERATE name;
```

- FOREACH … GENERATE

name	age
John	18
Mary	20

name
John
Mary

Store Data

```
STORE Names INTO 'names.out';
```

- STORE … INTO …
  - PigStorage(‘,’) to specify separator if multiple fields

Command - JOIN

```
Users = LOAD 'users' AS (name, age);
Pages = LOAD 'pages' AS (user, url);
Jnd   = JOIN Users BY name, Pages BY user;
```

name	age
John	18
Mary	20
Bob	30

user	url
John	yaho
Mary	goog
Bob	bing

name	age	user	url
John	18	John	yaho
Mary	20	Mary	goog
Bob	30	Bob	bing

Command - GROUP

```
Grpd  = GROUP Jnd by url;
describe Grpd;
```

name	age	url
John	18	yhoo
Mary	20	goog
Dee	25	yhoo
Kim	40	bing
Bob	30	bing

yhoo	(John, 18, yhoo) (Dee, 25, yhoo)
goog	(Mary, 20, goog)
bing	(Kim, 40, bing) (Bob, 30, bing)

Other Commands

- `PARALLEL` – controls #reducer
- `ORDER` – sort by a field
- `COUNT` – eval: count #elements
- `COGROUP` – structured JOIN

Features

Parameter Substitution

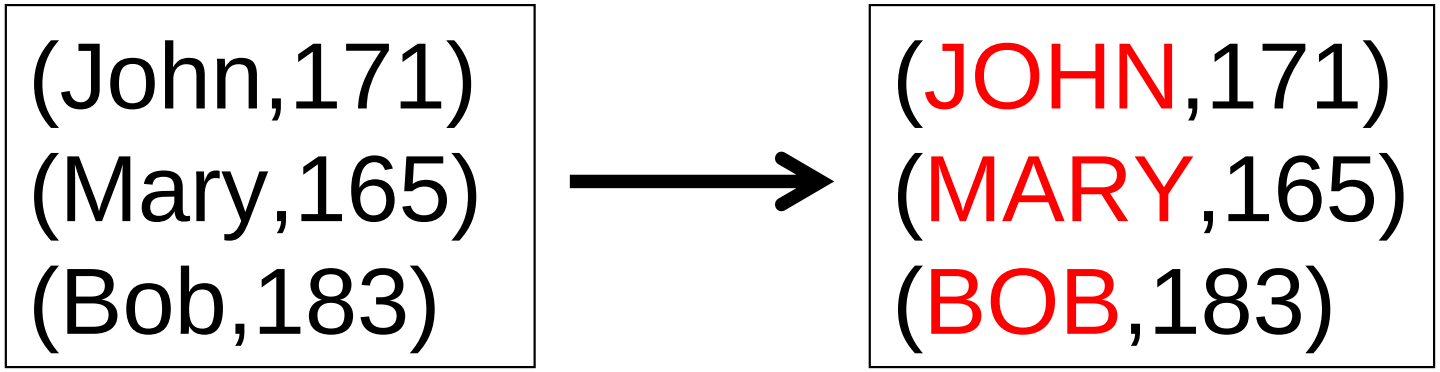
```
%default TYPE 'view'
%declare ID '18987'
A = load '/data/$DATE/$ID/$TYPE‘
```

- $ pig a.pig
- $ pig -param DATE=20091009 a.pig
- $ pig -param DATE=20091009 –param TYPE=click a.pig

RegEx Comparison

- `itsyou = FILTER urls by ($0 MATCHES 'http://.*\\.yahoo\\.com.*')`
- MATCHES matches ‘whole’ string
  - `‘aaaa’ MATCHES ‘aaa.*’` is true
  - `‘bbaaaa’ MATCHES ‘aaa.*’` is false
- pattern syntax: java.util.regex.Pattern

User-defined Function (UDF)



UDF – user function part

```
package myudf;
import java.io.IOException;
import org.apache.pig.EvalFunc;
import org.apache.pig.data.Tuple;

public class UPPER extends EvalFunc<String>
{
    public String exec(Tuple in) throws IOException {
        if (in == null || in.size() == 0) return null;
        String str = (String)in.get(0);
        return str.toUpperCase();
    }
}
```

- http://hadoop.apache.org/pig/javadoc/docs/api/
- PiggyBank
  - Pig users UDF repo
  - http://wiki.apache.org/pig/PiggyBank

Embedded in Java

```
/* create a pig server in the main class*/
{
  PigServer pigserver = new PigServer(args[0]);
   runMyQuery(pigServer, "/user/viraj/mydata.txt")
}

/* submit in function runMyQuery */

runMyQuery(PigServer pigServer, String inputFile) throws
IOException {
        pigServer.registerQuery("A = load '" + inputFile +
"' as (f1,f2,f3);");
        pigServer.registerQuery("B = group A by f1;");
        pigServer.registerQuery("C = foreach B generate
flatten(group);");
        pigServer.store("C", "/user/viraj/myoutput");
}
```

Parameter Substitution

```
$ pig -param myparam=val foo.pig
```

```
B = filter A by ($0 eq '$myparam');
```

- `pig -dryrun` produces processed script

```
B = filter A by ($0 eq 'val');
```

Parameter Substitution

- Params in file instead of command line
- `$ pig -param_file myparams.txt a.pig`

```
#myparams.txt
DATE=20081009
TYPE=clicks
```

UDF – build user function

- javac
  -cp $PIG_HOME/lib/pig.jar
  -sourcepath src

  src/myudf/UPPER.java
- jar cf myudf.jar -C classes myudf/UPPER.class

UDF – pig latin part

```

SQL vs. Pig Latin

SQL	Pig	Example
From table	Load file(s)	**SQL**: from X; **Pig**: A = load 'mydata' using PigStorage('\t') as (col1, col2, col3);
Select	Foreach … generate	**SQL**: select col1 + col2, col3 … **Pig**: B = foreach A generate col1 + col2, col3;
Where	Filter	**SQL**: select col1 + col2, col3 from X where col2>2; **Pig**: C = filter B by col2 > '2';

(adapted from Viraj's slide)

SQL vs. Pig Latin

SQL	Pig	Example
Group by	Group + foreach … generate	**SQL:** select col1, col2, sum(col3) from X group by col1, col2; **Pig**: D = group A by (col1, col2); E = foreach D generate flatten(group), SUM(A.col3);
Having	Filter	**SQL**: select col1, sum(col2) from X group by col1 having sum(col2) > 5; **Pig**: F = filter E by $1 > '5';
Order By	Order … By	**SQL**: select col1, sum(col2) from X group by col1 order by col1; **Pig**: H = ORDER E by $0;

(adapted from Viraj's slide)

SQL vs. Pig Latin

SQL	Pig	Example
Distinct	Distinct	**SQL:** select distinct col1 from X; **Pig:** I = foreach A generate col1; J = distinct I;
Distinct Agg	Distinct in foreach	**SQL:** select col1, count (distinct col2) from X group by col1; **Pig:** K = foreach D { L = distinct A.col2; generate flatten(group), SUM(L); }

(adapted from Viraj's slide)

SQL vs. Pig Latin

SQL	Pig	Example
Join	**Cogroup + flatten** **(also shortcut: JOIN)**	**SQL:** select A.col1, B.col3 from A join B using (col1); **Pig:** A = load 'data1' using PigStorage('\t') as (col1, col2); B = load 'data2' using PigStorage('\t') as (col1, col3); C = cogroup A by col1 **inner**, B by col1 **inner**; D = foreach C generate flatten(A), flatten(B); E = foreach D generate A.col1, B.col3;

(adapted from Viraj's slide)

Debug Tips

- Use small data and `pig -x local`
- `LIMIT`
  - `A = LOAD 'data' AS (a1,a2,a3)`
  - `B = LIMIT A 3;`
- `DUMP , DESCRIBE`

FAQ

- http://wiki.apache.org/pig/FAQ
  - can assign #reducer
  - support regex
  - can use allocated HOD cluster

pig.vim

- http://www.vim.org/scripts/script.php?script_id=2186

```
A = load 'data.txt' as (f1,f2,f3);
dump A;
B = foreach A generate f1,f3;
dump B;
store B into 'output.txt' using PigStorage('-');

專家談雲端：每個環節都有安全問題

ZDNet記者曠文溱／台北報導 雲端的安全問題不是無解，只是不管是雲端服務供應商或者想要建立私有雲的企業用戶，都必須考量到每個環節。

微軟亞太區全球技術支援中心專案經理、同時也是ZDNet專欄作家林宏嘉今（10）日在ZDNeT舉行的IT Priorities圓桌論壇中表示，雲端的安全議題涉及了IaaS、PaaS乃至於SaaS的每個層面。當然有些問題是原本就存在：例如在討論到IaaS時，就涉及到了機房的管理和硬體設備的可用性等；但是講到PaaS時，企業用戶倘若要選擇開原碼的作業系統，必須考量到後續的安全維護；在SaaS的層次，企業用戶必須確保每一個分區（partition）的安全更新和資料安全。

目前正如火如荼建立台灣第一個校園私有雲的台大計算機及資訊網路中心主任孫雅麗則呼應道，Amazon的雲端服務證實了在Hypervisor層有駭客入侵，也就是意味著過去大家在討論如何防範虛擬機器的資料安全，但是威脅已經深化到了更下一層。這些問題都有待解決。

「有些問題甚至是來自於內部，舉例而言，MIS可能會把存在記憶體裡的資料倒出來，或者在Hypervisor層就植入了可以蒐集資料的程式，」孫雅麗說。

安全議題是目前台灣企業對雲端持保留態度的最大主因，這也是何以台灣的大型企業對於雲端的想法，還是偏好建立私有雲，畢竟對用戶而言，要把資料放在別人家，還和其他企業一起共用一家，甚至是競爭對手「共處一室」，

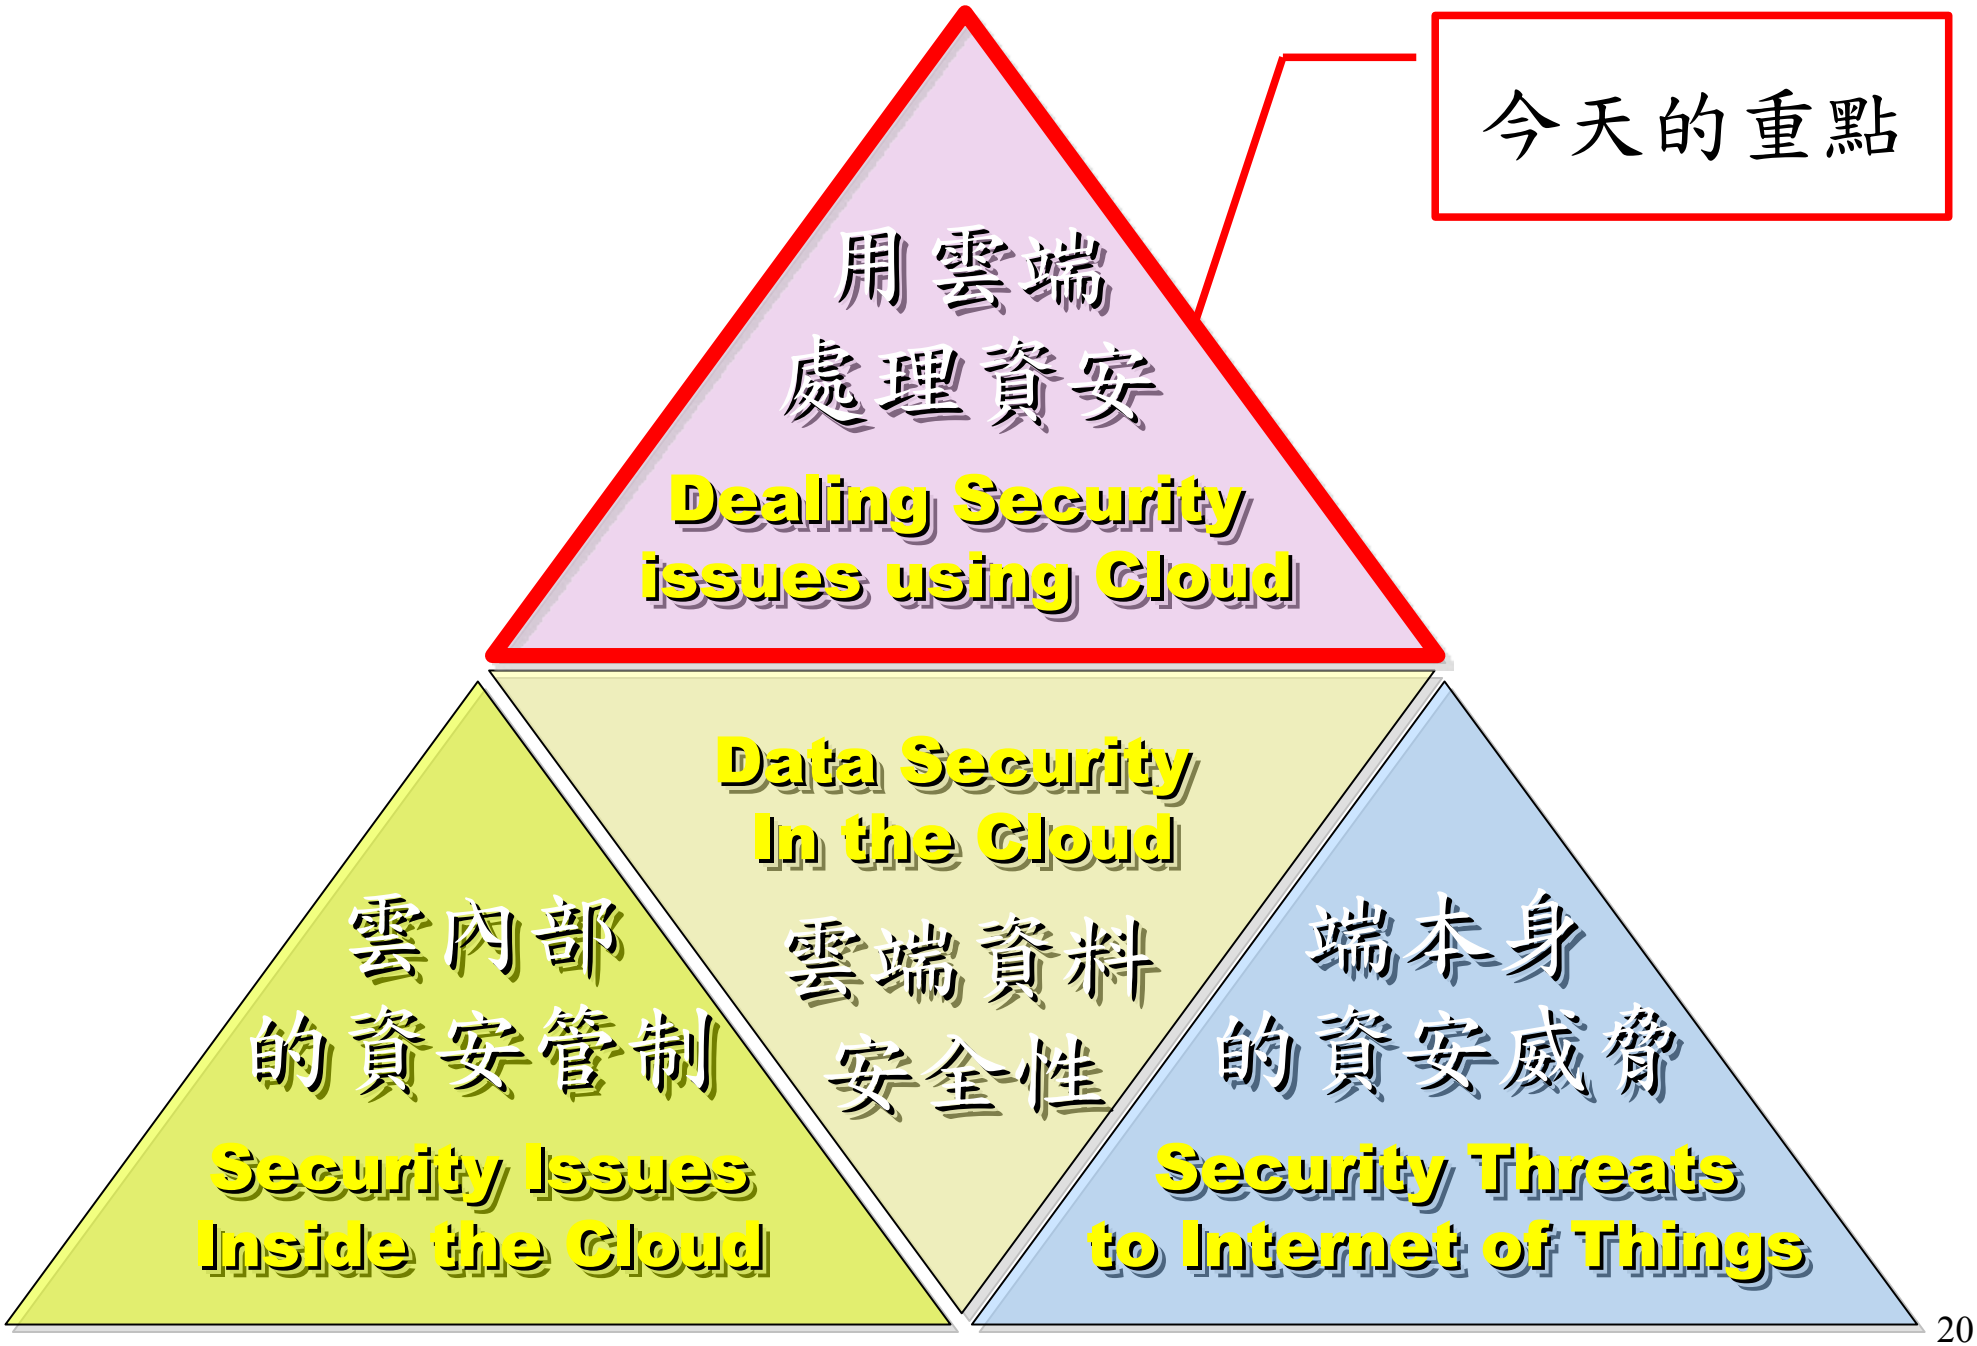
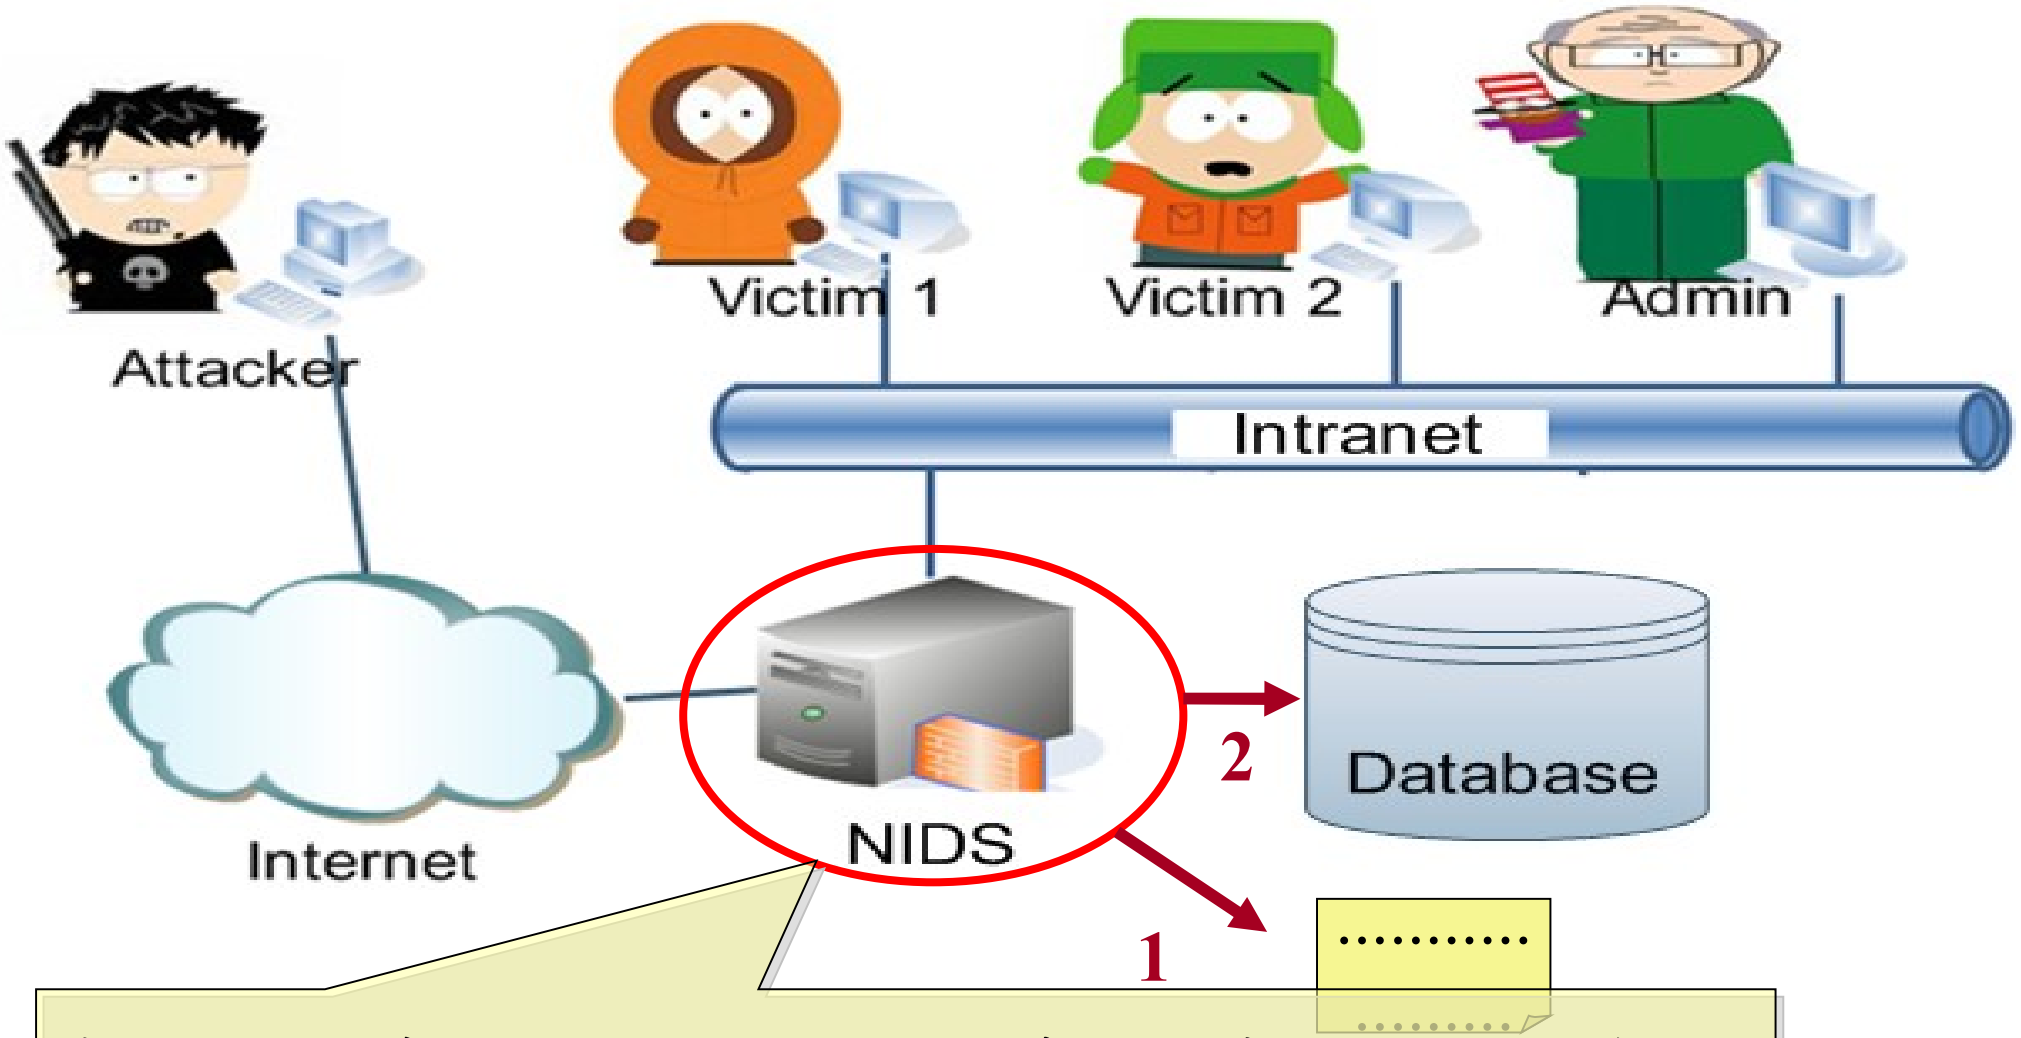
進入今天的主題：用雲端處理傳統資安問題



使用入侵偵測系統 (NIDS) 來找出入侵訊息



當入侵偵測系統偵測到網路上有異常封包時，就會產生警訊以告知有攻擊發生。警訊通常有兩種形式：

1. 紀錄成 log 檔　2. 紀錄到資料庫

傳統 NIDS 的警訊型態 (1) 紀錄在日誌檔內

入侵偵測系統所產生警訊日誌檔內一小段內容

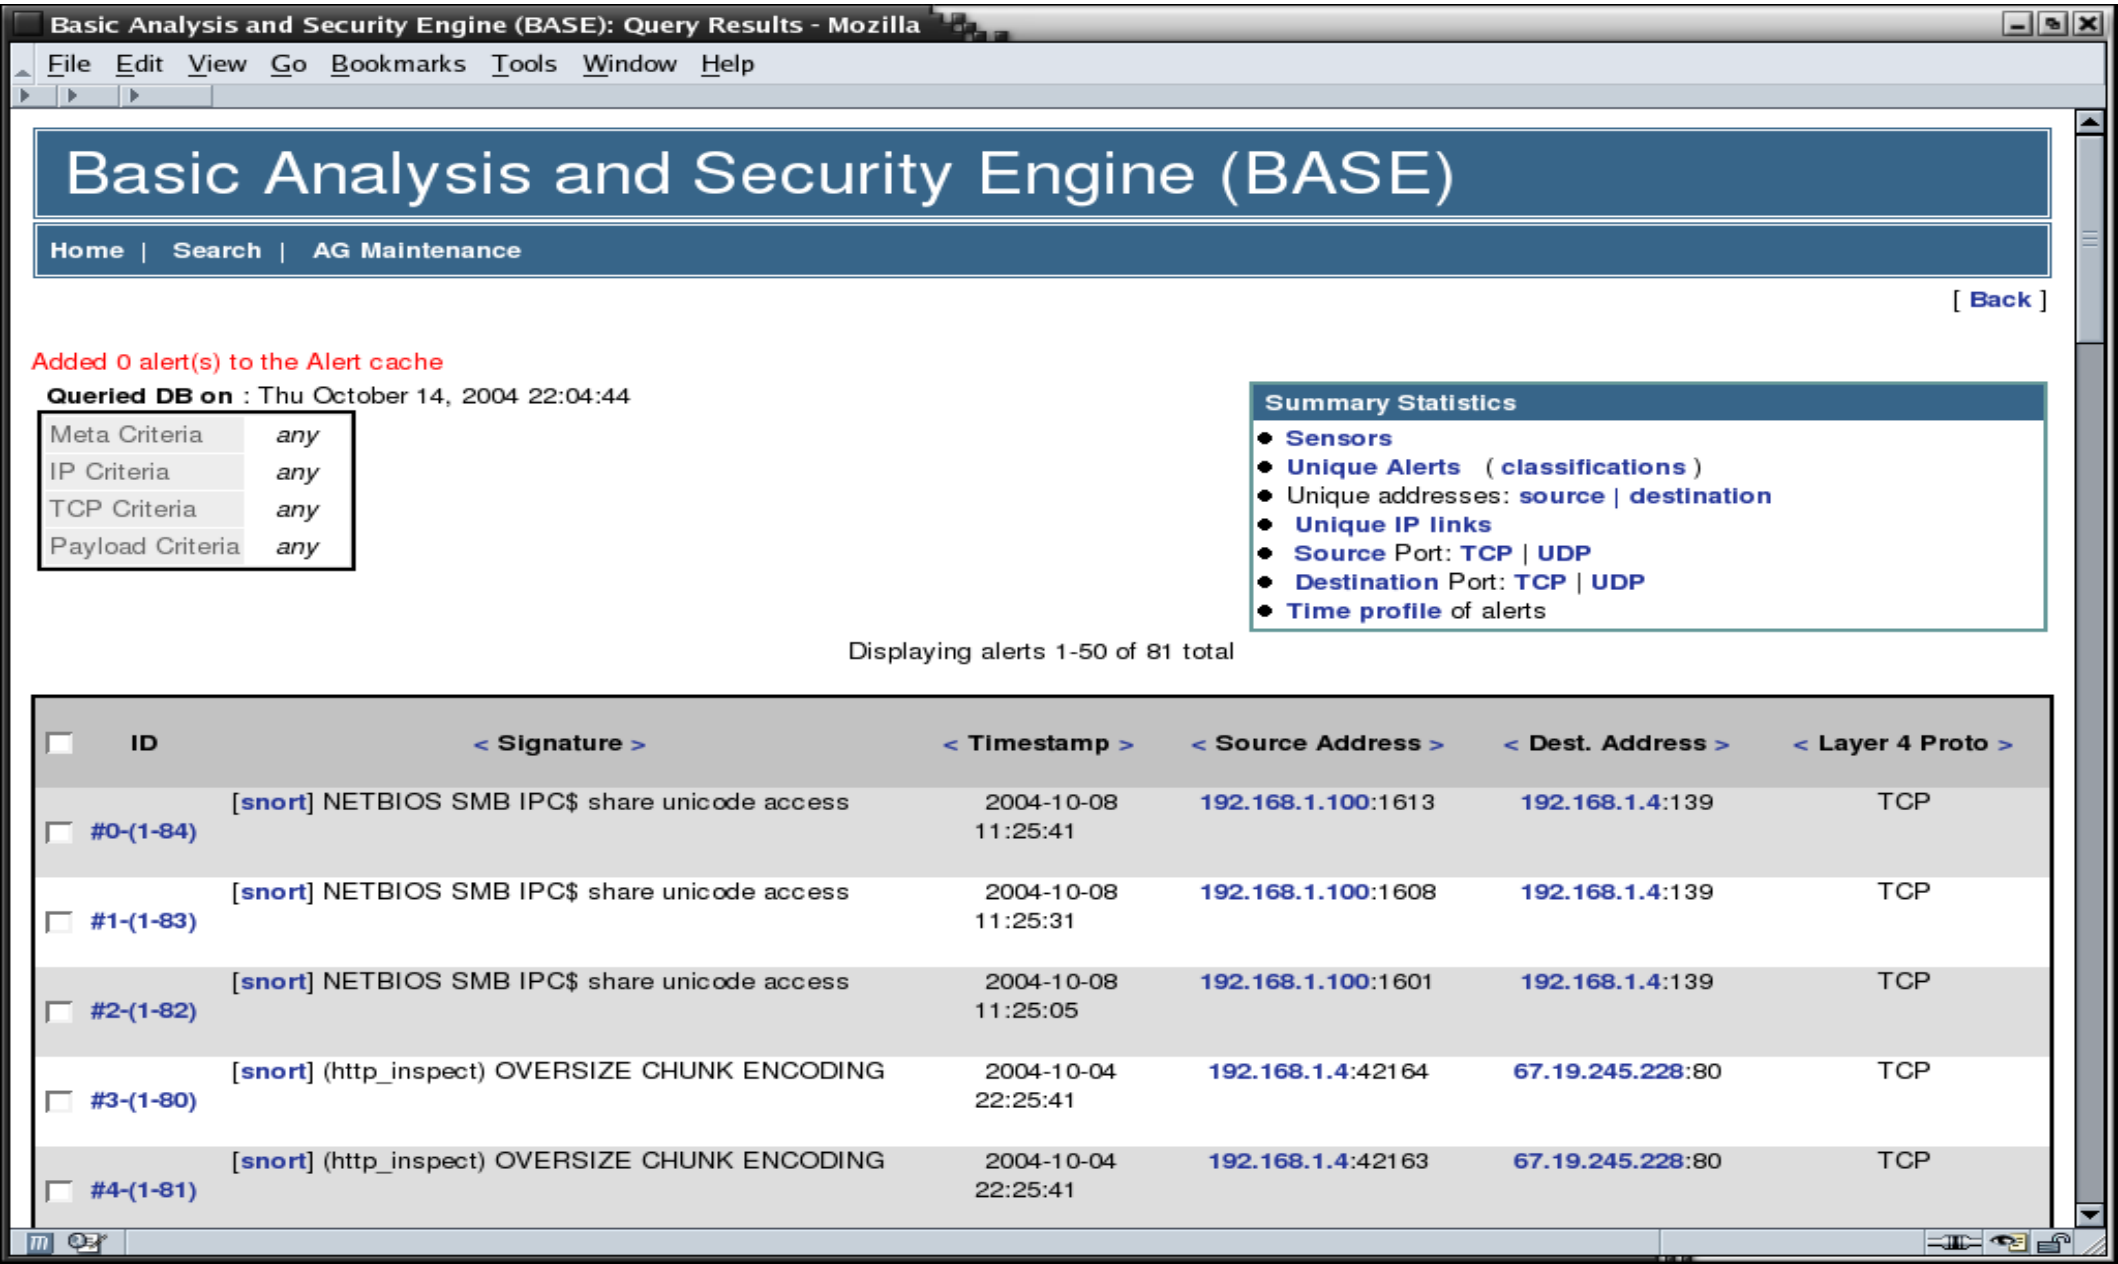
傳統 NIDS 的警訊型態 (2) 紀錄在資料庫內

以下為利用瀏覽器透過網頁方式呈現警訊資料庫的內容



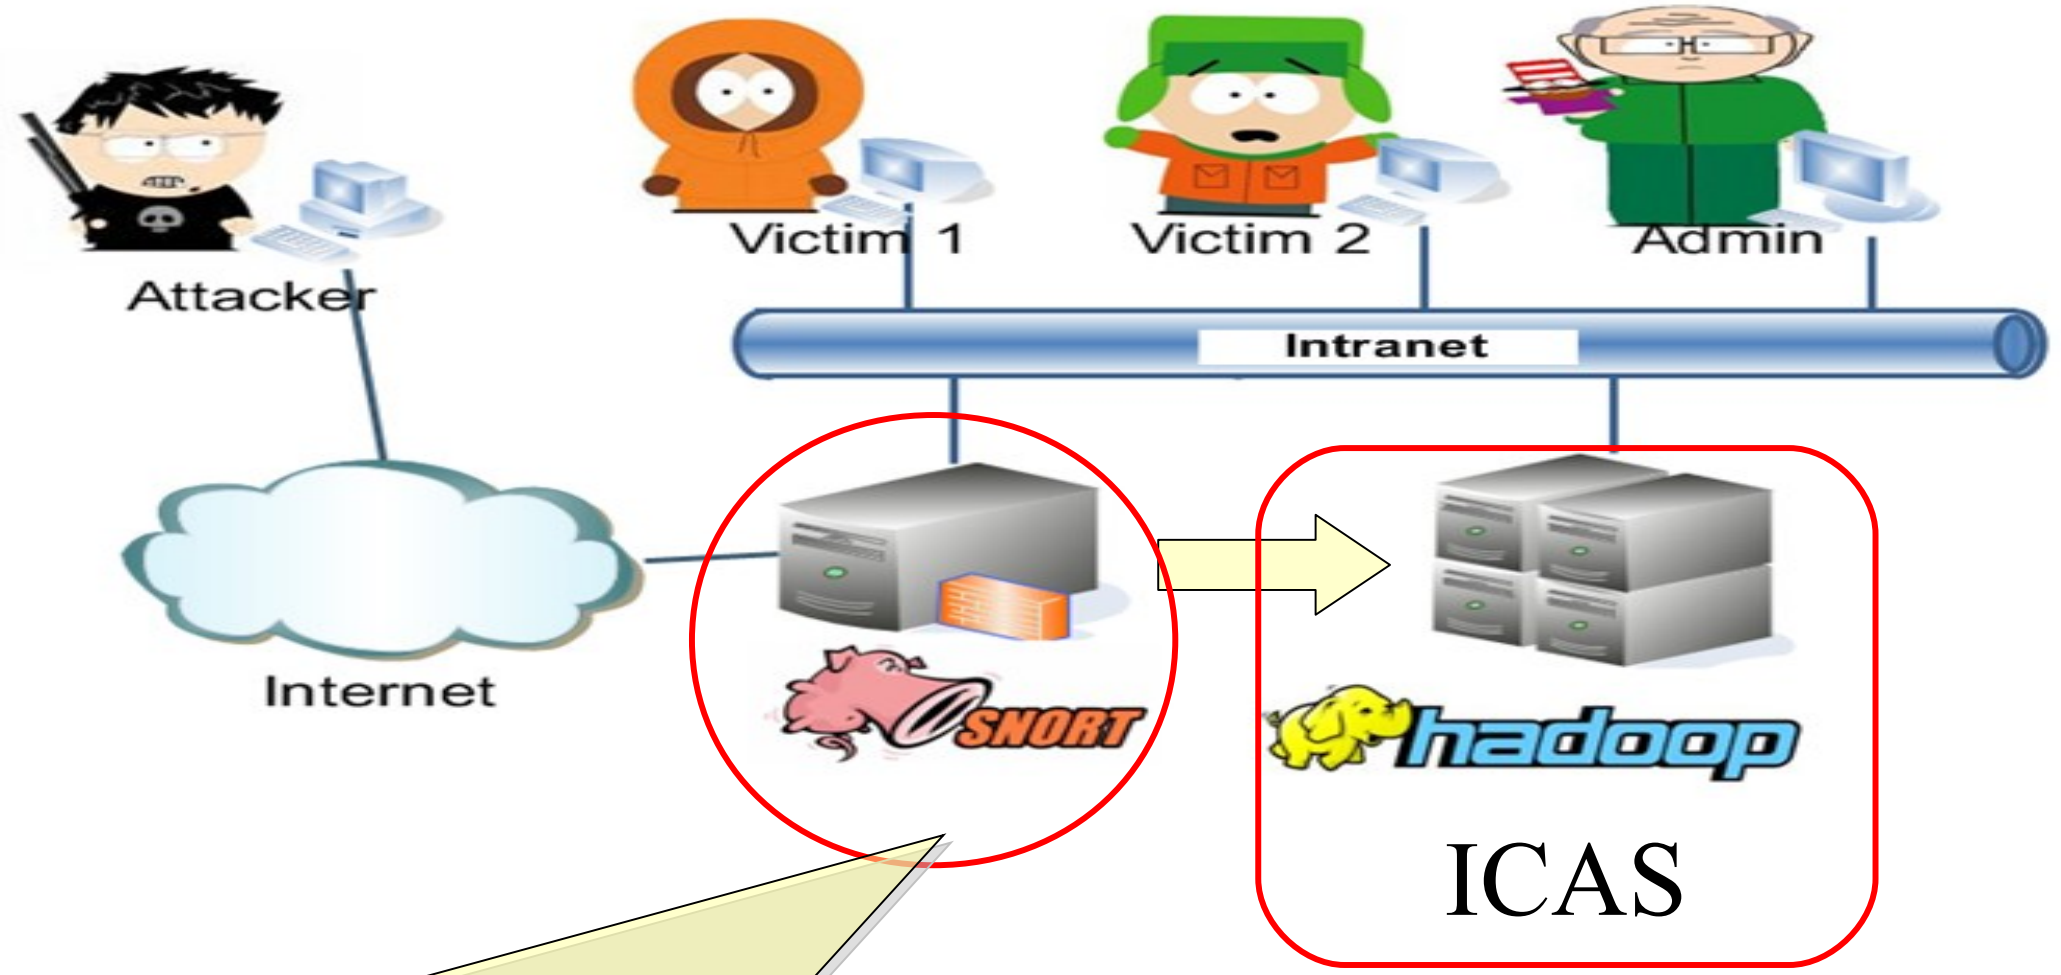
以上作法的缺點

- 警訊僅被『忠實』地被記錄下來，無法顯示彼此間的關聯性，因此系統管理者難以瞭解全部攻擊情形
- 過多的警訊，使得容易忽略重要內容
- 完全依賴單一台資料庫，當資料量一大，該台主機的讀寫效率將成為瓶頸

使用雲端運算的解決方案：ICAS

- ICAS, *IDS Cloud Analysis System*
- 利用雲端運算的特性提供以下好處
  - 對大量資料有高效率
  - 一般主機的叢集
  - 有錯誤容忍
- 分析演算法
  - 整合
  - 關聯

透過 ICAS 協助分析 IDS 的警訊



可多個 NIDS 共同產生警訊後，傳送至 ICAS ，分析演算法目前有 ICAS-I 及 ICAS-II

ICAS-I

- 將任意個原始警訊檔上傳到運行 ICAS-I 演算法的 Hadoop 檔案系統空間（ HDFS ）
- 利用 Hadoop 的 MapReduce 平台架構所設計的演算法來分析資料
- 分析完後的資料塞入分散式資料庫 HBase 內

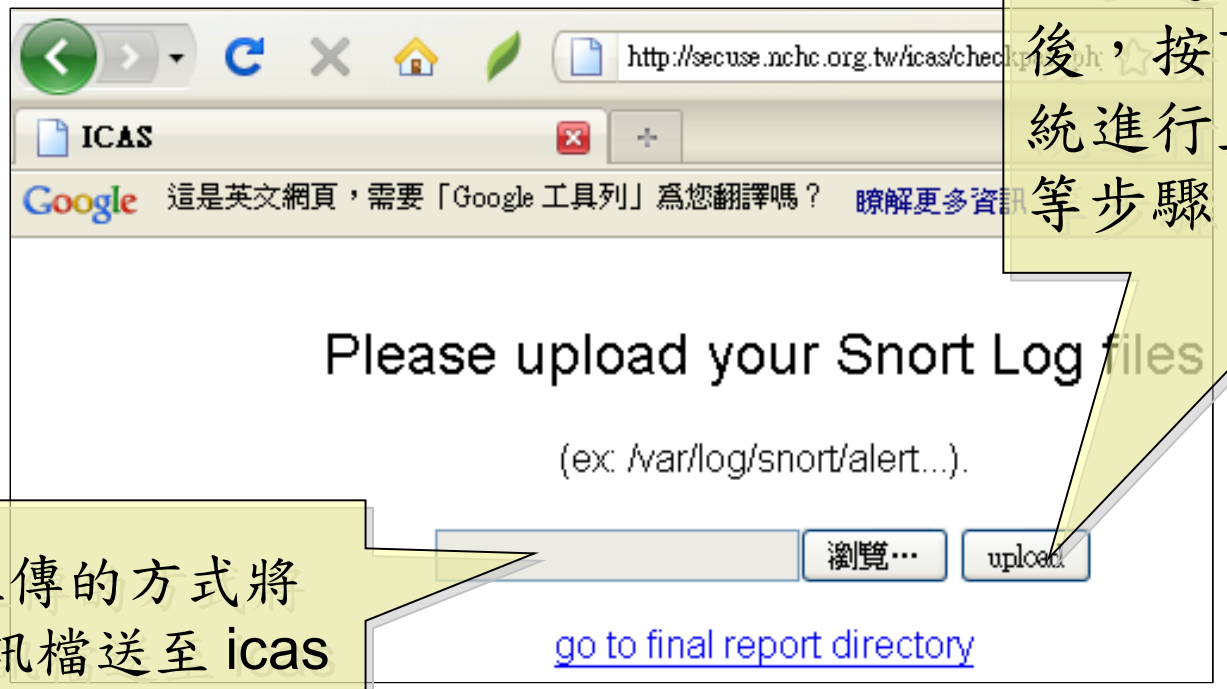
ICAS-II

- ICAS-I 僅將資料塞入資料庫，然而還是文字的敘述
- ICAS-II 將輸入的任意多個警訊整合成一張警訊關聯圖
- 資料的來源可以透過以下兩種方式上傳到分析平台
  - 系統自動設定以 SCP 傳送到 ICAS 工作目錄
  - 管理者透過 ICAS 網頁上傳

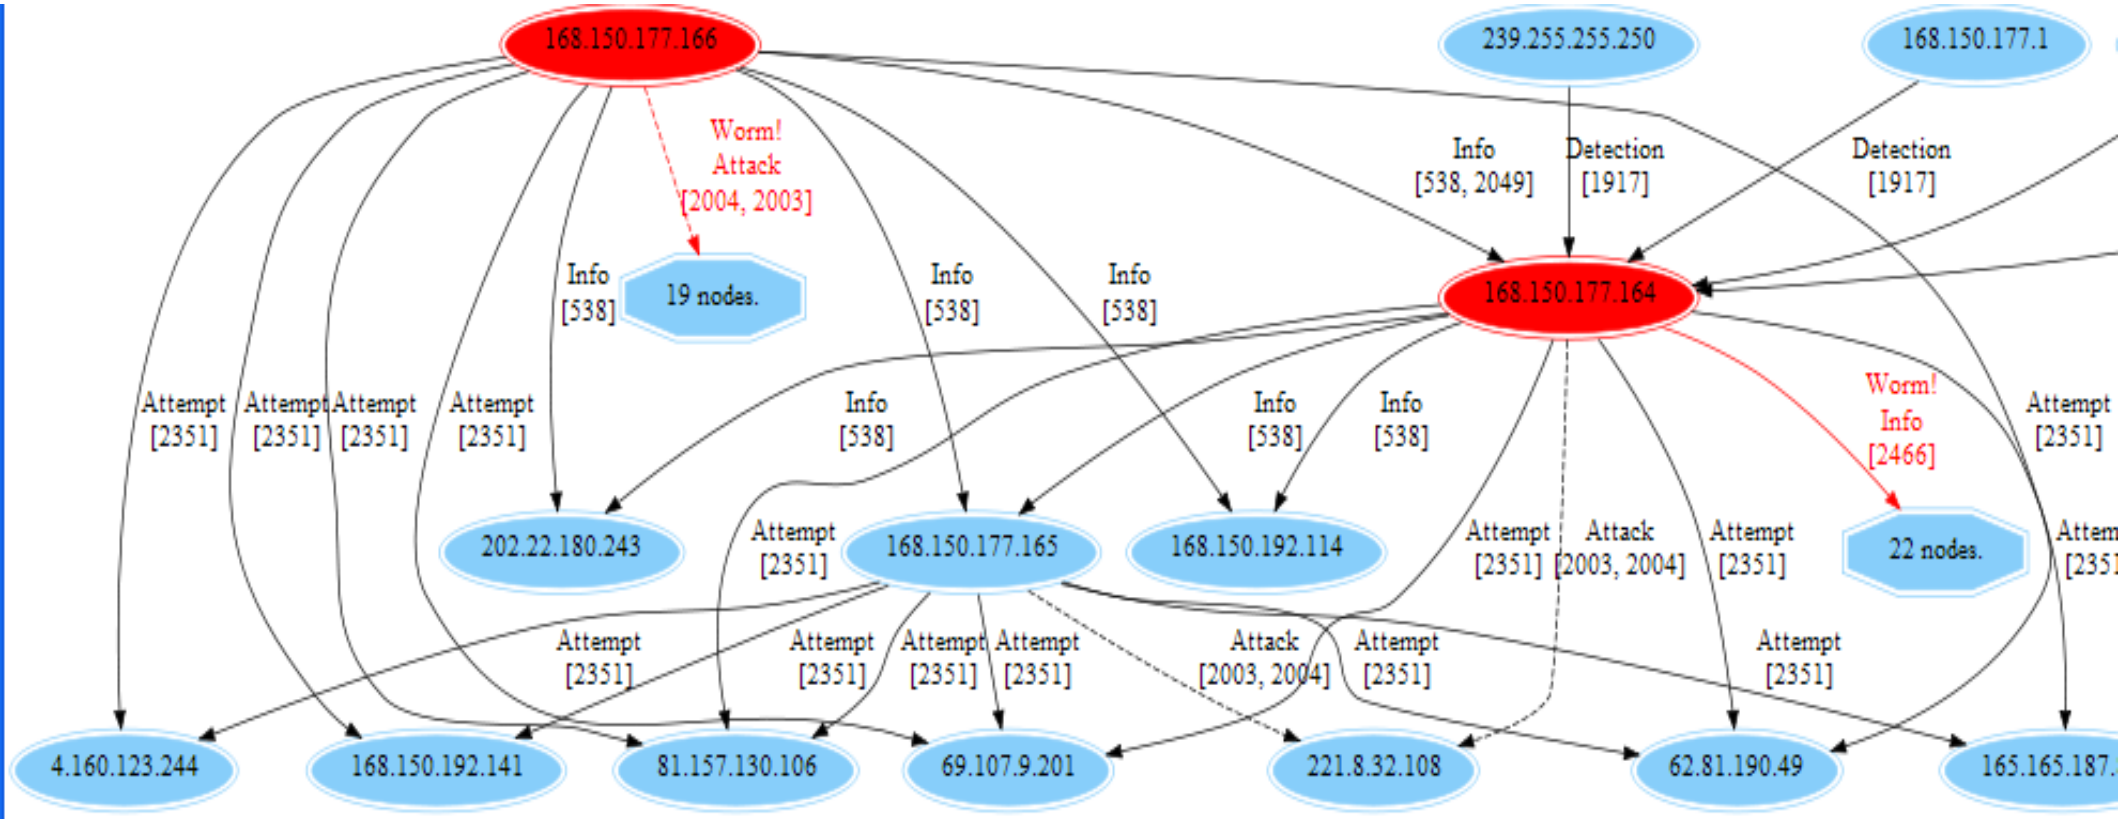


一旦選定需分析的日誌檔後，按下 upload 鈕，系統進行上傳→分析→繪圖等步驟

透過網頁上傳的方式將 snort 的警訊檔送至 icas 分析

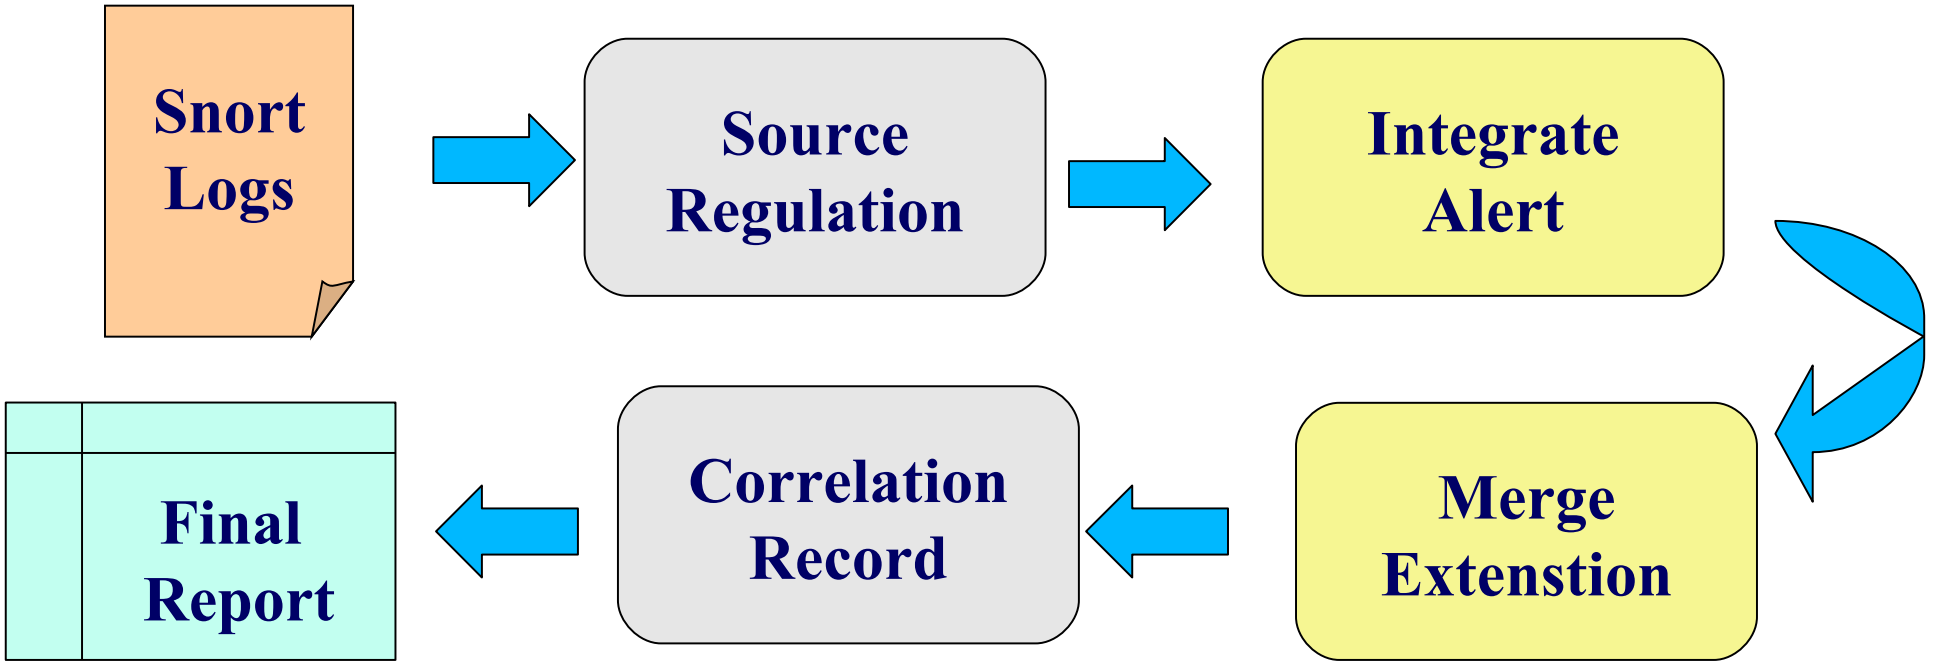
ICAS-II 所產生的報表：警訊關聯圖

- 經過 ICAS-II 分析後，可以得到此警訊關聯圖。
- 圖中橢圓形代表節點，箭頭及線上文字代表攻擊方向與攻擊方法。
- 標為紅色則是經過系統分析之後，被判定有攻擊行為的節點與方法。
- 此圖說明 IP 168.150.177.166 與 168.150.177.164 有進行蠕蟲的攻擊行為



ICAS-II 的分析流程

- Hadoop v 0.20



ICAS-II 結論

- ICAS-II 可經過警訊的來源、目的、攻擊事件綜合分析
  - 提供巨觀攻擊關聯圖來瞭解攻擊事件的始末
  - 自動透過標記顏色的方法將較高危險的事件呈現出來。
- ICAS-II 尚在整合關聯式資料庫，因此還未進行數據量測

ICAS 總結

- 雲端運算處理資料格式相似且資料量大的情況下，能展現其效益
- 提供高容錯率、低獨占系統資源、多工作同時執行等能力
- 可搭配其他軟體作即時的警訊資料呈現，ICAS 可補充分析後資料的部份
- 未來工作
  - 整合多種資料來源平台
  - 產生更詳細與人性化的分析資料
