The screenshot shows the Krugle search engine interface. At the top, there are navigation tabs for "Open Source Code", "Open Source Projects", and "SCM Comments". Below these are search filters: "[Clear Filters]", "[Advanced Search]", "Language: All", "Found in: Any area", and "Project: Enter project name". The search input field contains "nutch" and a "Search" button. The results section is titled "Results" and "Code Search for nutch". It shows "Code Files 1-10 (out of about 1849 matching files)". The first result is "Nutch.java" with a Creative Commons license icon, Apache-2.0 license, and author "J&eacute;rome Charron". The code snippet shows a public interface Nutch with a static final String ORIGINAL\_CHAR\_ENCODING = "OriginalCharEncoding";. The second result is also "Nutch.java" with a Nutch license icon, Apache-2.0 license, and the same author and code snippet. The third result is "NutchConfiguration.java" with a Nutch license icon, Apache-2.0 license, and author "J&eacute;rome Charron". The code snippet shows a utility class NutchConfiguration with a static final String KEY = NutchConfiguration.class.getName(); and a private NutchConfiguration() {} // singleton. The fourth result is "NutchJob.java" with a Nutch license icon, Apache-2.0 license, and a "Show Clones" link. The code snippet shows an import org.apache.hadoop.mapred.JobConf; and a public class NutchJob extends JobConf { with a constructor public NutchJob(Configuration conf) { super(conf, NutchJob.class);

# 架構

# 運作流程

- 1) 建立初始URL集
- 2) 將URL集注入crawldb---**inject**
- 3) 根據crawldb建立抓取清單---**generate**
- 4) 執行抓取，獲取網頁內容---**fetch**
- 5) 用獲取到的頁面資訊更新crawldb---**updatedb**
- 6) 重複進行3~5的步驟，直到預先設定的抓取深度
- 7) 更新linkdb ---**invertlinks**
- 8) 建立索引---**index**
- 9) 用戶通過用戶接口進行查詢操作
- 10) 將用戶查詢轉化為lucene查詢
- 11) 返回結果
